this book stems from a unique and a highly effective approach to introducing signal processing instrumentation diagnostics filtering control system integration and machine learning it presents the interactive industrial grade software testbed of mold oscillator that captures the distortion induced by beam resonance and uses

this testbed as a virtual lab to generate input output data records that permit unravelling complex system behavior enhancing signal processing modeling and simulation background and testing controller designs all topics are presented in a visually rich and mathematically well supported but not analytically overburdened format by incorporating software testbed into homework and project assignments the narrative guides a reader in an easily followed step by step fashion towards finding the mold oscillator disturbance removal solution currently used in the actual steel production while covering the key signal processing control system integration and machine learning concepts the presentation is extensively class tested and refined though the six year usage of the book material in a required engineering course at the university of illinois at urbana champaign
