nonholonomic motion planning grew out of the workshop that took place at the 1991 IEEE International Conference on Robotics and Automation. It consists of contributed chapters representing new developments in this area. Contributors to the book include robotics engineers, nonlinear control experts, differential geometers, and applied mathematicians. Nonholonomic motion planning is arranged into three chapter groups: controllability, one of the key mathematical tools needed to study nonholonomic motion; motion planning for mobile robots; in this section, the papers are focused on problems with nonholonomic velocity constraints as well as constraints on the generalized coordinates. Falling cats, space robots, and gauge theory: there are numerous connections to be made between symplectic geometry techniques for the study of holonomies in mechanics, gauge theory, and control. In this section, these connections are discussed using the backdrop of examples drawn from space robots and falling cats reorienting themselves. Nonholonomic motion planning can be used either as a reference for researchers working in the areas of robotics, nonlinear control, and differential geometry, or as a textbook for a graduate-level robotics or nonlinear control course.

The economic protection of the quality of the environment took shape properly in the middle of the 20th century when various economic instruments were proposed to policymakers. Today, protecting the environment is essential, as evidenced in the rise in temperatures, the melting of the icecaps, the disappearance of animal species, etc. Moreover, with recent advances in other disciplines, notably in psychology, economists are turning more and more towards non-monetary forms of incentive. However, questions concerning the effectiveness of these forms arise. Incentives and environmental policies: deals with the role of the economy in protecting the environment by revisiting traditional economic instruments and pursuing an advanced consideration of the role of new forms of incentive. It appears that in order to strive towards the best possible environmental quality, policymakers will have to take into account the future of many combinations of socially acceptable incentives.
