originally published in 1978 the process of question answering examines a phenomenon that relies on many realms of human cognition language comprehension memory retrieval and language generation problems in computational question answering assume a new perspective when question answering is viewed as a problem in natural language processing a theory of human question answering must necessarily entail a theory of human memory organization and theories of the cognitive processes that access and manipulate information in memory this book describes question answering as a particular task in information processing the theoretical models described here have been built on a formulation of general theories in natural language processing theories about language that were developed without the specific problem of question answering in mind by requiring programmers to be concerned with the precise form of information in memory and the precise operations manipulating that information they can uncover significant problems that would otherwise be overlooked an early insight into artificial intelligence today this reissue can be enjoyed in its historical context

the cooperation test apt francez de roever was originally conceived to capture the proof theoretical analogue of distributed message exchange between disjoint processes as opposed to the interference freedom test owicki gries being the proof theoretical analogue of concurrent communication by means of interference through jointly shared variables some authors levin gries lamport schneider schlichting and schneider stress that both forms of communication can be proof theoretically characterized using

interference freedom only since proofs for both ultimately amount to an invariance proof of a big global assertion ashcroft invariance of whose parts amounts to interference freedom yet i feel that the characteristic nature of the cooperation test is still preserved in the analysis of these authors because in their analysis of csp the part dealing with interference freedom specializes to maintenance of a global invariant the expression of which requires per process the introduction of auxiliary variables which are updated in that process only thus preserving the concept of disjointness as opposed to sharing since now all variables from different processes are disjoint the cooperation test has been applied to characterize concurrent communication as occurring in hoare s communicating sequential processes csp hoare 2 ichbiah s ada arm and brinch hansen s distributed processes dp brinch hansen this characterization has been certified through soundness and completeness proofs apt 2 gerth as in the interference freedom test this characterization consists of two stages a local sequential stage and a global stage
