probability statistics and other frightening stuff volume ii of the working guides to estimating forecasting series considers many of the commonly used descriptive statistics in the world of estimating and forecasting it considers values that are representative of the middle ground measures of central tendency and the degree of data scatter measures of dispersion and shape around the middle ground values a number of probability distributions and where they might be used are discussed along with some fascinating and useful rules of thumb or short cut properties that estimators and forecasters can exploit in plying their trade with the help of a correlation chicken the concept of partial correlation is explained including how the estimator or forecaster can exploit this in reflecting varying levels of independence and imperfect dependence between an output or predicted value such as cost and an input or predictor variable such as size under the guise of tails of the unexpected the book concludes with two chapters devoted to hypothesis testing or knowing when to accept or reject the validity of an assumed estimating relationship and a number of statistically based tests to help the estimator to decide whether to include or exclude a data point as an outlier one that appears not to be representative of that which the estimator is tasked to produce this is a valuable resource for estimators engineers accountants project risk specialists as well as students of cost engineering
