this book presents a unified and systematic philosophical account of human actions and their explanation and it does it in the spirit of scientific realism in addition various other related topics such as psychological concept formation and the nature of mental events and states are dis cussed this is due to the fact that the key problems in the philosophy of psychology are interconnected to a high degree this interwovenness has affected the discussion of these problems in that often the same topic is discussed in several contexts in the book i hope the reader does not find this too frustrating the theory of action developed in this book especially in its latter half is a causalist one in a sense it can be regarded as an explication and refin ment of a typical common sense view of actions and the mental episodes causally responsible for them it has of course not been possible to discuss all the relevant philosophical problems in great detail even if i have regarded it as necessary to give a brief treatment of relatively many problems rather i have concentrated on some key issues and hope that future research will help to clarify the rest

explanations are important to us in many contexts in science mathematics philosophy and also in everyday and juridical contexts but what is an explanation in the philosophical study of explanation there is long standing influential tradition that links explanation intimately to causation we often explain by providing accurate information about the causes of the phenomenon to be explained such causal accounts have been the received view of the nature of explanation particularly in philosophy of science since the 1980s however philosophers have recently begun to break with this causal tradition by shifting their focus to kinds of explanation that do not turn on causal information the increasing recognition of the importance of such non causal explanations in the sciences

first published in 1986 in the age of the computer conjecture about things mechanical has naturally led to the question of whether machines can think as the emphasis on artificial intelligence ai has grown rapidly questions about machine intelligence have begun to have a certain urgency the question we are concerned with in this book is if we can find a set of processes that machines can slavishly follow and if by so doing these machines can come up with creative thoughts what would that tell us about human beings if the machine's procedure was adapted from a human procedure that is if all the machine was doing was what we know people are doing would we abandon our inherent skepticism about the abilities of machines or would we demystify our inherent admiration for things human in a sense these are the issues dealt with in this book the author says in a sense because this book is no way a philosophical treatise rather it is an exercise in artificial intelligence and in cognitive science it is an attempt to come to understand one of the most complex problems of mind by examining some of the mechanisms of mind to define the apparatus that underlies our ability to think

this collection brings together a set of new papers that advance the debate concerning the nature of explanation in mind and brain science and help to clarify the prospects for bonafide integration across these fields long a topic of debate among philosophers and scientists alike there is growing appreciation that understanding the complex relationship between the psychological sciences and the neurosciences especially how their respective explanatory frameworks interrelate is of fundamental importance for achieving progress across these scientific domains traditional philosophical discussions tend to construe the relationship between them in stark terms either they are related in terms of complete independence i e autonomy or complete dependence i e reduction leaving little room for more interesting relations such as that of mutually beneficial interaction or integration a unifying thread across the diverse set of contributions to this volume is the rejection of the assumption that no stable middle ground exists between these two extremes and common embrace of the idea that these sciences are partially dependent on or constrained by one another by addressing whether the explanatory patterns employed across these domains are similar or different in kind and to what extent they inform and constrain each another this volume helps to deepen our understanding of the prospects for successfully integrating mind and brain science

since the ground breaking work of saul kripke david lewis and others in the 1960s and 70s one dominant interest of analytic philosophers has been in modal truths which concerns the questions of what is possible and what is necessary however there is considerable controversy over the source and nature of necessity in modality and explanatory reasoning boris kment takes a novel approach to the study of modality that places special emphasis on understanding the origin of modal notions in everyday thought kment argues that the concepts of necessity and possibility originate in a common type of thought experiment counterfactual reasoning that allows us to investigate explanatory connections this procedure is closely related to the controlled experiments of empirical science necessity is defined in terms of causation and other forms of explanation such as grounding the relation that connects metaphysically fundamental facts to non fundamental ones therefore contrary to a widespread view explanation is more fundamental than modality the study of modal facts is important for philosophy not because these facts are of much metaphysical interest in their own right but because they provide evidence about explanatory relationships in the course of developing this position the book offers new accounts of possible worlds counterfactual conditionals essential truths and their role in grounding and a novel theory of how counterfactuals relate to causation and explanation
