Creating Networks in Chemistry

2004-09-30

during the second half of the nineteenth century and the beginning of the twentieth century chemical societies were established all over

Europe the book focuses on this process and further development of the European chemical societies before World War I and in exceptional cases up to 1930 it comprises chapters based on a common set of questions and an extensive concluding chapter that provides a comparative analysis of the early development of the European chemical societies. The book offers unique historical material showing the social, intellectual, and political circumstances in which the chemical societies were constituted and function, their relations to universities and chemical industries, everyday lives, international contacts, etc. The analysis of data explores how networks in chemistry and professional autonomy were constituted and investigates the process of demarcation that inevitably takes place when a social institution of a scientific discipline is formed. The reader gets an answer to the important question of what chemistry was and was not in the latter half of the nineteenth century and the first decades of the twentieth century. Various aspects of creating scientific societies have been of much interest to historians of science in recent years. Nevertheless, histories of scientific societies are mostly occasional publications written to celebrate their jubilees. This volume represents a first international comparative analysis on the beginnings of chemical societies in Europe based on a detailed historical research done by a group of renowned historians of chemistry from several countries. As such, it is an entirely new contribution to the history of chemistry in Europe and European scientific societies in general and a unique source for chemists and historians. Its ambition is to become a reference work in history of chemistry, set the standard for similar studies in other disciplines, and serve European chemical societies to provide a context for their complex histories and relationships. The book can be read

by miscellaneous audiences and various types of readers with diverse intentions who will benefit differently from it a member of a national chemical society will find there narrative on his own society s establishment and early history and the opportunity to compare it with societies from other countries historically interested chemists will find in the book details as well as wider perspectives on the institutional history of their discipline historians of chemistry will get a thoroughly documented and scholarly book on the early history of chemical societies in europe written by acknowledged colleagues the individual chapters will offer additional literature and sources for their research into history of chemistry historians of science will get material for comparative studies on scientific institutions on the roles of learned societies on national and international level they can be inspired to create similar studies related to other scientific disciplines the underlying common set of guidelines can provide methodological assistance teachers of history of chemistry and history of science will find in the book additional reading material and literature social and general historians will be given a well edited and reliable source on a number of social institutions that played versatile roles in local national settings the establishment of chemical societies can be compared with other kinds of learned professional and amateur societies in the same period they also will get data and information about some aspects of the scientific boom in the second half of the nineteenth century and pre ww1 period

IAS Mains Paper 4 Ethics Integrity & Aptitude 2021

2012-12-06

the rivers run into the sea yet the sea is not full ecclesiastes what is quantum chemistry the straightforward answer is that it is what quantum chemists do but it must be admitted that in contrast to physicists and chemists quantum chemists seem to be a rather ill defined category of scientists quantum chemists are more or less physicists basically theoreticians more or less chemists and by large computationists but first and foremost we quantum chemists are conscious beings we may safely guess that quantum chemistry was one of the first areas in the natural sciences to lie on the boundaries of many disciplines we may certainly claim that quantum chemists were the first to use computers for really large scale calculations the scope of the problems which quantum chemistry wishes to answer and which by its unique nature only quantum chemistry can only answer is growing daily retrospectively we may guess that many of those problems meet a daily need or are say technical in some sense the rest are fundamental or conceptual the daily life of most quantum chemists is usually filled with grasping the more or less technical problems but it is at least as important to devote some time to

the other kind of problems whose solution will open up new perspectives for both quantum chemistry itself and for the natural sciences in general

2023-11-04

the aim of this work was to develop a chemical vapour deposition process and understand the growth of sp² hybridised boron nitride sp² bn thus the growth on different substrates together with the variation of growth parameters was investigated in details and is presented in the papers included in this thesis deposited films of sp² bn were characterised with the purpose to determine optimal deposition process parameters for the growth of high crystal quality thin films with further investigations of chemical composition morphology and other properties important for the implementation of this material towards electronic optoelectronic devices and devices based on graphene bn heterostructures for the growth of sp² bn triethyl boron and ammonia were employed as b and n precursors respectively pure h₂ as carrier gas is found to be necessary for the growth of crystalline sp² bn addition of small amount of silane to the gas mixture improves the crystalline quality of the growing sp² bn film it was observed that for the growth of crystalline sp² bn on c axis oriented al₂o₃ a thin and strained aln buffer layer is needed to support epitaxial growth of sp² bn while it was possible to deposit rhombohedral bn r bn on various polytypes of sic without the need for a buffer layer the growth temperature suitable for the growth of crystalline sp² bn is 1500 c nevertheless the growth of crystalline sp² bn was also observed on al₂o₃ with an aln buffer layer at a lower temperature of 1200 c growth at this low

temperature was found to be hardly controllable due to the low amount of si that is necessary at this temperature and its accumulation in the reaction cell when sic was used as a substrate at the growth temperature of 1200 c no crystalline sp² bn was formed according to x ray diffraction crystalline structure investigations of the deposited films showed formation of twinned r bn on both substrates used additionally it was found that the growth on al₂o₃ with an aln buffer layer starts with the formation of hexagonal bn h bn for a thickness of around 4 nm the formation of h bn was observed at growth temperatures of 1200 c and 1500 c on al₂o₃ with aln buffer layer while there were no traces of h bn found in the films deposited on sic substrates in the temperature range between 1200 c and 1700 c as an explanation for such growth behaviour reproduction of the substrate crystal stacking is suggested nucleation and growth mechanism are investigated and presented in the papers included in this thesis

Proceedings of the AEC Symposium for Chemical Processing of Irradiated Fuels from Power, Test, and Research Reactors

1902

trends in analytical chemistry volume 3 focuses on developments in analytical chemistry including the adoption of automation in laboratory processes chromatography and flow analysis the selection first underscores the effect of automation on the operations of analytical laboratories and techniques for the automated optimization of hplc separations topics include initial requirements window diagrams and chemometric approaches the text then ponders on generation of statistical tables by microcomputer enzyme electrodes for continuous in vivo monitoring and enantiomeric analysis of the common protein amino acids by liquid chromatography the publication takes a look at sample preparation for the analysis of heavy metals in foods and application of ion selective electrodes in flow analysis including dry ashing acid extraction and ion selective electrodes in flowing systems the text then examines trends in laboratory information management systems zone electrophoresis in open tubular capillaries and using computers to interpret ir spectra of complex molecules the selection is a valuable source of data for readers interested in the developments in analytical chemistry

Industrial Education

1902

there have been significant developments in the use of knowledge based expert systems in chemistry since the first edition of this book was published in 2009 this new edition has been thoroughly revised and updated to reflect the advances the underlying theme of the book is still the need for computer systems that work with uncertain or qualitative data to support decision making based on reasoned judgements with the continuing evolution of regulations for the assessment of chemical hazards and changes in thinking about how scientific decisions should be made that need is ever greater knowledge based expert systems are well established in chemistry especially in relation to toxicology and they are used routinely to support regulatory submissions the effectiveness and continued acceptance of computer prediction depends on our ability to assess the trustworthiness of predictions and the validity of the models on which they are based written by a pioneer in the field this book provides an essential reference for anyone interested in the

uses of artificial intelligence for decision making in chemistry

Trade and Technical Education

1902

the signaling dynamics in neuronal networks includes processes ranging from lifelong neuromodulation to direct synaptic neurotransmission in chemical synapses the time delay it takes to pass a signal from one neuron to the next lasts for less than a millisecond at the post synaptic neuron further signaling is either up or down regulated dependent on the specific neurotransmitter and receptor while this up and down regulation of signals usually runs perfectly well and enables complex performance even a minor dysfunction of this signaling system can cause

major complications in the shape of neurological disorders the field of organic bioelectronics has the ability to interface neurons with high spatiotemporal recording and stimulation techniques local chemical stimulation i e local release of neurotransmitters enables the possibility of artificially altering the chemical environment in dysfunctional signaling pathways to regain or restore neural function to successfully interface the biological nervous system with electronics a range of demands must be met organic bioelectronic techniques and materials are capable of reaching the demands on the biological as well as the electronic side of the interface these demands span from high performance biocompatible materials to miniaturized and specific device architectures and high dose control on demand within milliseconds the content of this thesis is a continuation of the development of organic bioelectronic devices for neurotransmitter delivery organic materials are utilized to electrically control the dose of charged neurotransmitters by translating electric charge into controlled artificial release the first part of the thesis papers 1 and 2 includes further development of the resistor type release device called the organic electronic ion pump this part includes material evaluation microfluidic incorporation and device design considerations the aim for the second part of this thesis papers 3 and 4 is to enhance temporal performance i e reduce the delay between electrical signal and neurotransmitter delivery to corresponding delay in biological neural signaling while retaining tight dosage control diffusion of neurotransmitters between nerve cells is a slow process but since it is restricted to short distances the total time delay is short in our organic bioelectronic devices several orders of magnitude in speed can be gained by switching from

lateral to vertical delivery geometries this is realized by two different types of vertical diodes combined with a lateral preload and waste configuration the vertical diode assembly was further expanded with a control electrode that enables individual addressing in each of several combined release sites these integrated circuits allow for release of neurotransmitters with high on off release ratios approaching delivery times on par with biological neurotransmission
