PC Mag 2001-02-06

this comprehensive and authoritative text reference presents a unique multidisciplinary perspective on shape perception in human and computer vision rather than focusing purely on the state of the art the book provides viewpoints from world class researchers reflecting broadly on the issues that have shaped the field drawing upon many years of experience each contributor discusses the trends followed and the progress made in addition to identifying the major challenges that still lie ahead topics and features

examines each topic from a range of viewpoints rather than promoting a specific paradigm discusses topics on contours shape hierarchies shape grammars shape priors and 3d shape inference reviews issues relating to surfaces invariants parts multiple views learning simplicity shape constancy and shape illusions addresses concepts from the historically separate disciplines of computer vision and human vision using the same language and methods

Computerworld 2018-05-18

john russ is the master of explaining how image processing gets applied to real world situations with brent neal he s done it again in measuring shape this time explaining an expanded toolbox of techniques that includes useful state of the art methods that can be applied to the broad problem of understanding characterizing and measuring shape he has a gift for finding the kernel of a particular algorithm explaining it in simple terms then giving concrete examples that are easily understood his perspective comes from solving real world problems and separating out what works in practice from what is just an abstract curiosity tom malzbender hewlett packard laboratories palo alto california usa useful for those working in fields including industrial quality control research and security applications measuring shape is a handbook for the practical application of shape measurement covering a wide range of shape measurements likely to be encountered in the literature and in software packages this book presents an intentionally diverse set of examples that illustrate and enable readers to compare methods used for measurement and quantitative description of 2d and 3d shapes it stands apart through its focus on examples and applications which help readers quickly grasp the usefulness of presented techniques without having to approach them through the underlying mathematics an elusive concept shape is a principal governing factor in determining the behavior of objects and structures essential to recognizing and classifying objects it is the central link in manmade and natural processes shape dictates everything from the stiffness of a construction beam to the ability of a leaf to catch water to the marketing and packaging of consumer products this book emphasizes techniques that are quantitative and produce a

meaningful yet compact set of numerical values that can be used for statistical analysis comparison correlation classification and identification written by two renowned authors from both industry and academia this resource explains why users should select a particular method rather than simply discussing how to use it showcasing each process in a clear accessible and well organized way they explore why a particular one might be appropriate in a given situation yet a poor choice in another providing extensive examples plus full mathematical descriptions of the various measurements involved they detail the advantages and limitations of each method and explain the ways they can be implemented to discover important correlations between shape and object history or behavior this uncommon assembly of information also includes sets of data on real world objects that are used to compare the performance and utility of the various presented approaches

while the scientific study of vision is well advanced a universal theory of qualitative visual appearances texture shape colour and so on is still lacking this interdisciplinary handbook presents the work of leading researchers around the world who have taken up the challenge of defining and formalizing the field of

experimental phenomenology presents and discusses a new perspective in vision science and formalizes a field of study that will become increasingly significant to researchers in visual science and beyond the contributors are outstanding scholars in their fields with impeccable academic credentials including jan j koenderink irving biederman donald hoffmann steven zucker and nikos logothetis divided into five parts linking psychophysics and qualities qualities in space time and motion appearances measurement and qualities science and aesthetics of appearances each chapter will have the same structure consisting of topic overview historical roots debate new perspective methods results and recent developments
