one of the fast growing elements of the internet is electronic commerce which refers to the use of electronic means to conduct business transactions within or across business entities nearly 80 percent of all fortune 500 companies have been doing their core business through the internet many issues and societal implications of electronic commerce are the subjects of recent research a supply chain consists of all the entities and activities that enable the production distribution and delivery of products and services to consumers research in designing and managing supply chains has rapidly expanded during the last decade in addition increased and accessible computing power and modeling capabilities have spurred this growth enabling researchers to simultaneously consider the many interrelated variables and decisions of a supply chain in a single tractable model

supply relations are often governed by so called relational contracts these are informal agreements sustained by the value of future cooperation although relational contracts persist in practice research on these types of contract is only emerging in operations and supply chain management this book studies a two firm supply chain where repeated transactions via well established supply contracts and continued quality improvement efforts are governed by a relational contract we are able to characterize an optimal relational contract i e to develop policies for supplier and buyer that structure investments in quality and flexibility in a way that no other self enforcing contract generates higher expected joint surplus a second goal is to compare the performance of different returns mechanisms in the context of

relational contracting quantity flexibility and buy back contracts industry studies motivate the presented model

supplier relationship managers often find it difficult to evaluate and optimize supplier relationships which are crucial to the success of their business yet complex and multifaceted characterized by long term orientation uncertainty temporal evolution idiosyncratic investment improvement potential and adaptation flexibility how to design optimal supply contracts to govern supplier relationships has been a common problem in business practice for many years this book draws on the modern theories of investment under uncertainty in the finance literature and proposes a hierarchical dynamic and value based solution for supplier relationship and supply contract management at the strategic level the author addresses supplier relationship management by putting forward a three layer relationship valuation procedure and a fuzzy stochastic relationship valuation model in addition decision models for managing a supplier relationship life cycle as well as configuring and planning supplier relationship portfolios are presented at the tactical level the author deals with supply contract management a general compound supply contract model is proposed and how to design optimal supply contracts under demand risk and price risk is explored furthermore the contract portfolio configuration problem is discussed

this book is devoted to analysis and design of supply chain contracts with stochastic demand given the extensive utilization of contracts in supply chains the issues concerning contract analysis and design are extremely important for supply chain management scm and substantial research has been developed to address those issues over the past years despite the abundance of classical research new research needs to be conducted in response to new issues emerging with the recent changing business environments such as the fast shortening life cycle of product and the increasing globalization of supply chains this book addresses these issues with the intention to present new research on how to apply contracts to improve scm contract analysis and design for supply chains with stochastic demand contains eight chapters and each chapter is summarized as follows chapter 1 provides a comprehensive review of the classical development of supply chain contracts chapter 2 examines the effects of demand uncertainty on the applicability of buyback contracts chapter 3 conducts a mean risk analysis for wholesale price contracts taking into account contracting value risk and risk preferences chapter 4 studies the optimization of product service system by franchise fee contracts in the service oriented manufacturing supply chain with demand information asymmetry chapter 5 develops a bidirectional option contract model and explores the optimal contracting decisions and supply chain coordination issue with the bidirectional option chapter 6 addresses supply chain options pricing issue and a value based pricing scheme is developed for the supply chain options with a cooperative game theory approach chapter 7 explores the issues concerning supply chain contract selection implementation with the option contract under consideration chapter 8 concludes the book and suggests worthy directions for future research

quantitative models and computer based tools are essential for making decisions in today s business environment these tools are of particular importance in the rapidly growing area of supply chain management this volume is a unified effort to provide a systematic summary of the large variety of new issues being considered the new set of models being developed the new techniques for analysis and the computational methods that have become available recently the volume s objective is to provide a self contained sophisticated research summary a snapshot at this point of time in the area of quantitative models for supply chain management while there are some multi disciplinary aspects of supply chain management not covered here the editors and their contributors have captured many important developments in this rapidly expanding field the 26 chapters can be divided into six categories basic concepts and technical material chapters 1 6 the chapters in this category focus on introducing basic concepts providing mathematical background and validating algorithmic tools to solve operational problems in supply chains supply contracts chapters 7 10 in this category the primary focus is on design and evaluation of supply contracts between independent agents in the supply chain value of information chapters 11 13 the chapters in this category explicitly model the effect of information on decision making and on supply chain performance managing product variety chapters 16 19 the chapters in this category analyze the effects of product variety and the different strategies to manage it international operations chapters 20 22 the three chapters in this category provide an overview of research in the emerging area of international operations conceptual issues and new challenges

chapters 23-27 these chapters outline a variety of frameworks that can be explored and used in future research efforts this volume can serve as a graduate text as a reference for researchers and as a guide for further development of this field

integrated supply chain planning is well understood by theory and widely applied in practice however only with respect to intra organisational supply chains in inter organisational supply chains an additional yet unresolved problem arises due to confidentiality reasons decentralized parties keep their local data private which prevents an integrated planning local planning procedures such as upstream planning which are usually applied then result in suboptimal solutions for the supply chain as a whole in this work new mechanisms for inter organizational collaborative supply chain planning are presented these mechanisms are able to identify the systemwide optimum for several classes of supply chain planning problems they can be applied by two or more self interested parties and do not require a trusted third party extensive computational tests for randomly generated and real word data suggest a favorable performance of these mechanisms

we confess that the first part of our title is somewhat of a misnomer bayesian reasoning is a normative approach to probabilistic belief revision and as such it is in need of no improvement rather it is the typical individual whose reasoning and judgments often fall short of the bayesian ideal who is the focus of improvement what have we learnt from over a half century of research and theory on this topic that could explain why people are often non bayesian can bayesian reasoning be facilitated and if so why these are the questions that motivate this frontiers in psychology research topic bayes theorem named after english statistician philosopher and presbyterian minister thomas bayes offers a method for updating one s prior probability of an hypothesis  $h$  on the basis of new data  $d$  such that  $p(h|d) \propto p(h)p(d|h)$  the first wave of psychological research pioneered by ward edwards revealed that people were overly conservative in updating their posterior probabilities i e  $p(d|h)$  a second wave spearheaded by daniel kahneman and amos tversky showed that people often ignored prior probabilities or base rates where the priors had a frequentist interpretation and hence were not bayesians at all in the 1990s a third wave of research spurred by leda cosmides and john tooby and by gerd gigerenzer and ulrich hoffrage showed that people can reason more like a bayesian if only the information provided takes the form of non relativized natural frequencies although kahneman and tversky had already noted the advantages of frequency representations it was the third wave scholars who pushed the prescriptive agenda arguing that there are feasible and effective methods for improving belief revision most scholars now agree that natural frequency representations do facilitate bayesian reasoning however they do not agree on why this is so the original third wave scholars favor an evolutionary account that posits human brain adaptation to natural frequency processing but almost as soon as this view was proposed other scholars challenged it arguing that such evolutionary assumptions were not needed the dominant opposing view has been that the benefit of natural frequencies is mainly due to the fact that such representations make the nested set relations perfectly transparent thus people can more easily see what information they need to focus on and how to simply combine it this research topic aims to take stock of where we are at present are we in a proto fourth wave if so does it offer a synthesis of recent theoretical disagreements the second part of the title orients the reader to the two main subtopics what works and why in terms of the first subtopic we seek contributions that advance understanding of how to improve people s abilities to revise their beliefs and to integrate probabilistic information effectively the second subtopic centers on explaining why methods that improve non bayesian reasoning work as well as they do in addressing that issue we welcome both critical analyses of existing theories as well as fresh perspectives for both subtopics we welcome the full range of manuscript types
