1951 application of scientific findings to effective practice and informed policymaking is an aspiration for much research in the biomedical behavioural and developmental sciences but too often translations of science to practice are conceptually narrow ethically underspecified and developed quickly as salves to an urgent problem for developmental science widely implemented parenting interventions are prime examples of technical translations from knowledge about the causes of children s mental distress aiming to support family relationships and facilitate adaptive child development these programmes are rushed through when the scientific findings on which they are based remain contested and without ethical grounding of their aims in matters of significance marinus van ijendoorn and marian bakermans kranenburg draw on 40 years of experience with theoretical empirical meta analytic and translational work in child development research to highlight the complex relations between replication translation and academic freedom they argue that challenging fake facts promulgated by under replicated and under powered studies is a critical type of translation beyond technical applications such challenges can in the highlighted field of attachment and emotion regulation research bust popular myths about the decisive role of genes hormones or the brain on parenting and child development with a balancing impact for practice and policymaking the authors argue that academic freedom from interference by pressure groups stakeholders funders or university administrators in the core stages of research is a necessary but besieged condition for adversarial research and myth busting praise for matters of significance this thoughtful volume is an accessible overview of the authors field shaping collaborative research on attachment and an indispensable primer on differentiating between sense and nonsense in the service of producing cumulative developmental science and ethically translating its core insights glenn i roisman university of minnesota the truly original arguments presented in matters of significance go beyond attachment as they concern the nature of developmental science and its relation to ethical cultural legal and political issues jay belsky university of california davis

2018-06-25 one health meets the exposome human wildlife and ecosystem health brings together the two powerful conceptual frameworks of one health and the exposome to comprehensively examine the myriad of biological environmental social and cultural challenges impacting the interrelated health of humans wildlife and ecosystems one health as an encompassing concept and collaborative framework recognizes the interconnections among humans wildlife and our shared environment with the goal of optimizing health outcomes for all the exposome is more specifically oriented to human health and considers cumulative environmental exposures affecting individuals communities and populations this book will provide the broadened and integrative view that considers a

more holistic approach needed to confront the complex issues facing us today one health meets the exposome human wildlife and ecosystem health is a valuable and cutting edge resource for researchers and practitioners in medicine public health animal science wildlife and field biology and for any reader looking to better understand the relationships among human health and the environment examines one health historical focus on disease transfer from wildlife to humans analyzes the transition of the one health concept to a current multi and trans disciplinary framework with global programs aimed at optimizing human and wildlife health defines the exposome and current approaches to conceptualize environmental impacts on human health bridges the concepts of one health and the exposome by comparing contrasting and visualizing synergistic and integrative conceptual frameworks
