the integration of data video and voice types of communication services with a factor called bandwidth brought optical communications towards an emerging technology

Optical Communications

the day when fiber will deliver new yet now only foreseeable broadband services to the end user is getting nearer and nearer as we make our way towards the prophetic year 2000 step by step as we move from first generation lasers and fibers to the by now common erbium doped fiber amplifiers looking forward to such things as wavelength multiplexing and solitons photonic switching and optical storage the community of researchers in optical communications has stepped into the era of photonic networks it is not just a question of terminology optical communication means technology to the same extent that photonic network means services if it is true that information is just as marketable a product as oil or coke the providing of an extensive global information infrastructure may end up having an even greater impact than the setting up of a world wide railroad network did at the beginning of the industrial era just like wagons bandwidth will be responsible for carrying and delivering goods to customers the challenge for all of us in this field is for it to function in every section of the overall network transport access and customer area in the best possible way the fastest most economical and most flexible new services provided by a new network that exploits the potential and peculiarities of photonics surely requires a rethinking of solutions new ideas new architectures new design especially where electronics is still dominant as in transport and access networks

keiser has developed this readable tour through the basics and cutting edge applications of optical communications for non specialist engineers and lower tech readers broken into short 20 25 page modules complete with illustrations and sidebars this is a completely new approach to the topic ideal for use in the classroom independent study or corporate training

Optical Communications Essentials

2003

in the last few years the subject of optical communications has moved rapidly from being a promising research area to a practical reality already being installed and carrying traffic in trunk networks in many countries at the same time new applications for fibre technology are emerging and are placing new demands on the system components in telecommunications there is a steady increase of interest in the use of fibres for undersea cables in local area networks and wideband links and a little further ahead the possibility of coherent communications systems with an optical carrier bandwidth of 200 thz today s maximum bit rates of the order of gb s l do not approach the limits of the medium and questions about the ultimate limits of optical communications are already being asked on a different front the rapid advance of fibre sensors previously drawing heavily on the communications technology is becoming a major driving force in the development of fibres and other components this picture of dramatic growth in optical technology gives rise to other phenomena a profusion of small companies mushrooms to meet the demands of specific market areas each such company formed around a nucleus of experienced personnel from the established research groups multi nationals jostle for position in the optoelectronics marketplace and price wars develop as fibre costs fall university groups expand with government and industrial funding in attempts to maintain long term research options and produce trained personnel

the advantages of optical communications are many ultra high speed highly reliable information transmission and cost effective modulation and transmission links to name but a few it is no surprise that optical fiber communications systems are now in extensive use all over the world along with software and microelectronics optical communication represents a key technology of modern telecommunication systems optical communications components and systems provides the basic material required for advanced study in theory and applications of optical fiber and space communication systems after a review of some fundamental background material component based chapters discuss all relevant passive and active optical and optoelectronic components used in point to point links and in networks systems chapters address the analysis and optimization of both incoherent and coherent systems introduce fiber optic link design and discuss physical limits the authors also provide an overview of applications such as optical networks and optical free space communications the advanced interactive multimedia communications of today and the future rely on optical fiber and space communication techniques optical communications components and systems offers engineers and physicists a working reference for the selection and design of optical communication systems and provides engineering students with a valuable text that prepares them for work in this essential and rapidly growing field

this resource provides the latest details on 5th generation photonic systems that can be readily applied to projects in the field moreover the book provides valuable time saving tools for network simulation and modeling it includes coverage of optical signal transmission systems and networks a wide range of critical methods and techniques such as mimo multiple input and multiple output by employing spatial modes in few mode and multicore optical

fiber ofdm orthogonal frequency division multiplexing utilized to enhance the spectral efficiency and to enable elastic optical networking schemes and advanced modulation and coding schemes to approach the shannon s channel capacity limit there are detailed discussions on the basic principles and applications of high speed digital signal processing as well as description of the most relevant post detection compensation techniques
