recent advances in techniques available to memory researchers have led to a rapid expansion in the field of cognitive neuroscience of memory this book provides accessible coverage of four key areas of recent advance including research on functional imaging electrophysiological and lesion studies and developments from the computational modelling approach the first section reviews functional imaging studies in humans with particular emphasis on how imaging methods have clarified the cortical areas involved in memory formation and retrieval the second section describes electrophysiological and lesion research in monkeys where lesion and disconnection studies are rapidly adding to our knowledge of both information processing and modulatory

aspects of memory formation in the third section electrophysiological and lesion studies in rats are reviewed allowing for a detailed study of the role of novelty and exploration in memory formation the final section reviews current research in computational modelling which has allowed the development of new theoretical and experimental approaches to the study of memory encoding and retrieval this volume draws together the current developments in each field allowing the synthesis of ideas and providing converging evidence from a range of sources it will be a useful resource for both advanced undergraduate and postgraduate students of psychology as well as researchers in the field and anyone with an interest in cognitive neuroscience

neuroscience the study of the structure and function of the brain has captured our imaginations breakthrough technologies permit neuroscientists to probe how the human brain works in ever more fascinating detail revealing what happens when we think move love hate and fear we know more than ever before about what goes wrong in the brain when we develop psychiatric and neurological illnesses like depression dementia

epilepsy panic attacks and schizophrenia we also now have clues about how treatments for those disorders change the way our brains look and function neuroscience at the intersection of mind and brain has three main purposes first it makes complicated concepts and findings in modern neuroscience accessible to anyone with an interest in how the brain works second it explains in detail how every experience we have from the moment we are conceived changes our brains third it advances the idea that psychotherapy is a type of life experience that alters brain function and corrects aberrant brain connections among the topics covered are what makes our brains different from those of other primates our nearest genetic neighbors how do life's experiences affect genetic expression of the brain and the way neurons connect with each other why are connections between different parts of the brain important in both health and disease what happens in the brains of animals and humans when we are suddenly afraid of something get depressed or fall in love how do medications and psychotherapies work the information in this book is based on cutting edge research in neuroscience psychiatry and psychology written by an author who studied human behavior and brain function for three decades it is presented in a highly accessible manner full of personal anecdotes and observations and touches on many of the controversies in contemporary mental health practice
