CARE-S 2006-03-31

care s presents the result of an extensive eu project computer aided rehabilitation of sewer and storm water networks the projects developed a complete management system for sewer and storm water assets including methods and software it comprises methods and models for

the three levels necessary of management namely the long term planning the project ranking and the technology selection the results of a comprehensive testing of care s in representative european cities are also included in the book long term planning relies on state of the art description judgement of future service life and available measurements including cctv this information is handled in tools for performance indicators network condition prediction and investment needs project ranking is conducted by an elimination system and includes analysis by tools for structural condition hydraulic performance and customer requirements the system identifies projects that can be included within actual budget limits selection of appropriate technologies relies on a comprehensive database for renovation and repair techniques and their properties applied into the conditions of the single projects the purpose of this book is to present a new generation management system of sewer and storm water assets due to ageing systems and increasing demands to these networks and the complexity of systems and problems advanced management systems are necessary to secure an optimal use of limited resources for repair maintenance and renewal in the future management should be based on solid objective information given by computer programs and databases and judged by professional management engineers the market for modern urban water network management including software and consulting services is expected to increase substantially during the coming years this is the first book to consider a complete management system for sewer and storm water assets the book presents a system that will improve the cost effectiveness of sewer and storm water assets by at least 10 the book presents the methodology and software for modern maintenance and renewal of wastewater networks

intelligent building is the future of our building industry all commercial residential industrial and institutional buildings will be designed towards the goal of intelligent buildings the most important aspect of an intelligent building is the building systems such as electrical services heating ventilation and air conditioning systems vertical transportation systems and life safety systems which must operate intelligently and efficiently to enhance the activities of the occupants intelligent building systems explains what already exists in a modern intelligent building and describes what is currently being developed by researchers to improve human comfort working efficiency and energy performance for buildings in the 21st century intelligent building systems is divided into three parts the first part gives a quick review of the structure terminology layout and operating principles of most standard modern building systems the second part introduces the background material necessary to understand intelligent building systems including information on electronics technology fundamental mathematics and techniques in artificial intelligence and signal processing these first two parts are the foundation for the final part which consists of research works carried out by the authors and other researchers in the application of artificial intelligence to building systems the technologies presented will encourage readers to envision new and innovative ideas on possible future applications intelligent building systems is relevant to practitioners and researchers in the area of architectural science and engineering electrical and mechanical services and intelligent buildings it may also be used as a text for advanced courses on the topic

in security science efficient operation depends typically on the interaction between technology human and machine detection and human and machine decision making a perfect example of this interplay is gatekeeping which is aimed to prevent the passage of people and objects that represent known threats from one end to the other end of an access point gatekeeping is most often achieved via visual inspections mass screening random sample probing and or more targeted controls on attempted passages at points of entry points of entry may be physical e g national borders or virtual e g connection log ons who and what are defined as security threats and the resources available to gatekeepers determine the type of checks and technologies that are put in place to ensure appropriate access control more often than not the net performance of technology aided screening and authentication systems ultimately depends on the characteristics of human operators assessing cognitive affective behavioural perceptual and brain processes that may affect gatekeepers while undertaking this task is fundamental on the other hand assessing the same processes in those individuals who try to breach access to secure systems e g hackers and try to cheat controls e g smugglers is equally fundamental and challenging from a security standpoint it is vital to be able to anticipate focus on and correctly interpret the signals connected with such attempts to breach access and or elude controls in order to be proactive and to enact appropriate responses knowing cognitive behavioral social and neural constraints that may affect the security enterprise will undoubtedly result in a more effective deployment of existing human and technological resources studying how inter observer variability human factors and biology may affect the security agenda and the usability of existing security technologies is of great economic and policy interest in addition brain sciences may suggest the possibility of novel methods of surveillance and intelligence gathering this is just one example of a typical security issue that may be fruitfully tackled from a neuroscientific and interdisciplinary perspective the objective of our research topic was to document across relevant disciplines some of the most recent developments ideas methods and empirical findings that have the potential to expand our knowledge of the human factors involved in the security process to this end we welcomed empirical contributions using different methodologies such as those applied in human cognitive neuroscience biometrics and ethology we also accepted original theoretical contributions in the form of review articles perspectives or opinion papers on this topic the submissions brought together researchers from different backgrounds to discuss topics which have scientific applicative and social relevance
