this book represents the efforts of over a hundred individuals who planned and executed the nsts field experiments analyzed the billions of data points and distilled their findings and insights into the summaries found here because these experiments were of a scope that will seldom if ever be duplicated and because the program brought together many of the foremost field experimentalists in this country we all felt from the beginning that it was important to preserve the outcome this was done in two ways first the raw data were made available to any interested investigator within 18 months of the completion of each experiment secondly both the methodology of the experiments and the findings from them were codified in the form of a monograph this book is that result i have had the occasion recently sediments 87 proceedings vol 1 pp 642 651 to assess the nsts performance i found that we made giant strides in our understanding of the surf zone hydrodynamics far more than our fondest expectations at the beginning we were able to do less than we had hoped about the response of the sediment largely because of a limited ability to measure it at a point as i reported in the sediments 87 assessment we established a new state of the art in measurement techniques and we demonstrated the effectiveness of large multi investigator instrument intensive experiments for studying nearshore processes
