

# Epub free Clinical examination of the nervous system .pdf

The organized network of nerve tissue in the body it includes the central nervous system the brain and spinal cord the peripheral nervous system nerves that extend from the spinal cord to the rest of the body and other nerve tissue. In biology the nervous system is the highly complex part of an animal that coordinates its actions and sensory information by transmitting signals to and from different parts of its body. The nervous system detects environmental changes that impact the body then works in tandem with the endocrine system to respond to such events.

1. Nervous system organized group of cells specialized for the conduction of electrochemical stimuli from sensory receptors through a network to the site at which a response occurs follow the electrical and chemical changes undergone to transmit an impulse through the human nervous system.

The nervous system is a network of neurons whose main feature is to generate modulate and transmit information between all the different parts of the human body. This property enables many important functions of the nervous system such as regulation of vital body functions heartbeat breathing digestion sensation.

Your nervous system is your body's command center it's made up of your brain spinal cord and nerves. Your nervous system works by sending messages or electrical signals between your brain and all the other parts of your body.

The human nervous system the series of cells and nerve tracts that conduct stimuli from sensory receptors in the periphery to receptors in the brain and spinal cord and then conduct impulses back to other body parts.

The nervous system in a human is made of the brain spinal cord sensory organs and all the neurons that serve as communication channels between the various organs of the body. It is primarily made of a single type of cell called the neuron colloquially they are also called nerve cells.
