industry the testing and diagnosis of digital electronic circuits has been successfully developed to the point that it can be automated unfortu nately its development for analog electronic circuits is still in its stone age the engineer s intuition is still the most powerful tool used in the industry there are two reasons for this one is that there has been no pressing need from the industry analog circuits are usually small in size sometimes the engineer s experience and intuition are sufficient to fulfill the need the other reason is that there are no breakthrough results from academic re search to provide the industry with critical ideas to develop tools this is not because of a lack of effort both academic and industrial research groups have made major efforts to look into this problem unfortunately the prob lem for analog circuits is fundamentally different from and much more diffi cult than its counterpart for digital circuits these efforts have led to some important findings but are still not at the point of being practically useful however these situations are now changing the current trend for the design of vlsi chips is to use analog digital hybrid circuits instead of digital circuits from the past therefore even ix x preface though the analog circuit may be small the total circuit under testing is large this study summarizes the design rationale of a supine seat and restraint harness with

surrounding inclosure for high stress bio science experiments with a macaca cynomolgus monkey macaca iris this configuration is intended for test under various abnormal stresses including high g centrifuge runs testing and feeding of the subject in the inclosure will be accomplished to determine his reaction to these stresses with minimum modification the macaque supine seat and restraint harness could accept any primate for ground tests or bio experiments in space flight a brief description of an earlier supine test seat and restraint harness for low stress experiments using a
