james d watson when in late march of 1953 francis crick and i came to write the first nature paper describing the double helical structure of the dna molecule francis had wanted to include a lengthy discussion of the genetic implications of a

molecule whose struc ture we had divined from a minimum of experimental data and on theoretical argu ments based on physical principles but i felt that this might be tempting fate given that we had not yet seen the detailed evidence from king s college nevertheless we reached a compromise and decided to include a sentence that pointed to the biological significance of the molecule s key feature the complementary pairing of the bases it has not escaped our notice francis wrote that the specific pairing that we have postulated immediately suggests a possible copying mechanism for the genetic material by may when we were writing the second nature paper i was more confident that the proposed structure was at the very least substantially correct so that this second paper contains a discussion of molecular self duplication using templates or molds we pointed out that as a consequence of base pairing a dna molecule has two chains that are complementary to each other each chain could then act as a template for the formation on itself of a new companion chain so that eventually we shall have two pairs of chains where we only had one before and moreover
