a comprehensive graduate level textbook that takes a fresh approach to complex analysis a course in complex analysis explores a central branch of mathematical analysis with broad applications in mathematics and other fields such as physics and engineering ideally designed for a year long graduate course on complex analysis and based on nearly twenty years of classroom lectures this modern and comprehensive textbook is equally suited for independent study or as a reference for more experienced scholars saeed zakeri guides the reader through a journey that highlights the topological and geometric themes of complex analysis and provides a solid foundation for more advanced studies particularly in riemann surfaces conformal geometry and dynamics he presents all the main topics of classical theory in great depth and blends them seamlessly with many elegant developments that are not commonly found in textbooks at this level they include the dynamics of möbius transformations schlicht functions and distortion theorems boundary behavior of conformal and harmonic maps analytic arcs and the general reflection principle hausdorff dimension and holomorphic removability a multifaceted approach to the theorems of picard and montel zalcman s rescaling theorem conformal metrics and ahlfors s generalization of the schwarz lemma holomorphic branched coverings geometry of the modular group and the uniformization theorem for spherical domains written with exceptional clarity and insightful style a course in complex analysis is accessible to beginning graduate students and advanced undergraduates with some background knowledge of analysis and topology zakeri includes more than 350 problems with problem sets at the end of each chapter along with numerous carefully selected examples this well organized and richly illustrated book is peppered throughout with marginal notes of historical and expository value presenting a wealth of material in a single volume a course in complex analysis will be a valuable resource for students and working mathematicians

a discussion by an assembly of expert physicists and materials scientists embracing the specific features of vortex pin interactions the modes of different kinds of vortex motion under the action of lorentz force and the mechanisms of dissipation the effects of transport and screening currents superimposed ac magnetic fields and the microwave electromagnetic irradiation on vortex behaviour define the electromagnetic properties of a high tc superconducting material the mechanisms driving the depinning of vortices and the dynamics of their motion determine the critical current density and its file

dependence the mechanisms of energy dissipation and linear and nonlinear resistivity ac losses and noise in electronic circuitry the book therefore has direct implications for the development of new devices and components in electrical engineering modern electronics computer technology and microwave communication
