the rapid growth of iot and its applications in smart cities pose significant challenges for academic scholars the increasing number of interconnected devices and the massive amounts of data they generate strain traditional networks leading to inefficiencies and security vulnerabilities additionally the centralized control plane in software defined networks sdn presents a single point of failure hindering network performance while iot devices themselves are susceptible to attacks compromising user data and privacy to address these pressing issues network enabled iot applications for smart city services offers a compelling solution edited by dr k hemant kumar reddy dr diptendu sinharoy and tapas mishra this book advocates leveraging sdn to handle high frequency data streams effectively it also proposes the integration of blockchain technology to enhance security and reliability in iot applications offering a roadmap for scholars to improve network efficiency security and reliability in iot and smart city domains with their extensive expertise the authors provide academic scholars with a comprehensive and innovative resource that inspires further research and development in this evolving field enabling them to make significant contributions to the advancement of iot and smart city technologies

recent years have seen unprecedented outbreaks of avian influenza viruses in particular highly pathogenic h5n1 viruses have not only resulted in widespread outbreaks in domestic poultry but have been transmitted to humans resulting in numerous fatalities the rapid expansion in their geographic distribution and the possibility that these viruses could acquire the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality an effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic however current influenza vaccines are directed at existing seasonal influenza viruses which have little or no antigenic relationship to the highly pathogenic h5n1 strains concerns about pandemic preparedness have greatly stimulated research activities to develop effective vaccines for pandemic influenza viruses and to overcome the limitations inherent in current approaches to vaccine production and distribution these limitations include the use of embryonated chicken eggs as the substrate for vaccine production which is time consuming and could involve potential biohazards in growth of new virus strains other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes requiring trained personnel which could be a bottleneck when attempting to vaccinate large populations in mass campaigns in addition the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated
