new epidemics such as aids and mad cow disease have dramatized the need to explore the factors underlying rapid viral evolution and emerging viruses this comprehensive volume is the first to describe this multifaceted new field it places viral evolution and emergence in a historical context describes the interaction of viruses with hosts and details the advances in molecular biology and epidemiology that have provided the tools necessary to track developing viral epidemics and to detect new viruses far more successfully than could be done in the recent past this unique book also lucidly details case histories and offers practical suggestions for the prevention of future epidemics the contributors are leading authorities in their disciplines and were selected both for their expert

knowledge and for their ability to define and elucidate the fundamental issues the book is highly accessible and has been written for a wide audience that includes virologists public health authorities medical anthropologists evolutionary biologists geneticists infectious disease specialists and social scientists interested in medical and health issues

the pregnant host is at risk for any of the viral diseases her nonpregnant counterpart acquires additionally pregnancy heightens our concerns regarding specific viral diseases because of their potential for enhanced adverse effects on both maternal and fetal well being all too often the obstetrician relinquishes responsibility for the management of the gravida infected by a viral pathogen and those expert in infectious diseases are confounded by the influence of pregnancy on these conditions a major goal of this textbook is to narrow the gap between the two aforementioned management dichotomies in the virally infected pregnant woman we are at the infancy of our understanding of viral infections in pregnancy the current and anticipated advancements are due in large part to a burgeoning of technological achievements in the areas of immunodiagnosics molecular biology and pharmacotherapeutics our in utero diagnostic capabilities both invasive and noninvasive have also allowed us new opportunities to study the effects of various maternal infectious disease processes on the developing fetus new insights have been recognized pertaining to the maternal fetal interface the placenta in that this structure is now acknowledged to function as both a mechanical and an immunological barrier to vertical transmission of infection these observations suggest that there will be an outpouring of new data in the next several years that clinicians will need to master to maintain an appropriate level of expertise in the care of their patients

this paper develops a gravity model framework to estimate the impact of infectious diseases on bilateral tourism flows among 38 184 pairs of countries over the period 1995 2017 the results confirm that international tourism is adversely affected by disease risk and the magnitude of this negative effect is statistically and economically significant in the case of sars for example a 10 percent rise in confirmed cases leads to a reduction of as much as 9 percent in tourist arrivals furthermore while infectious diseases appear to have a smaller and statistically insignificant negative effect on tourism flows to advanced economies the magnitude and statistical significance of the impact of infectious diseases are much greater in developing countries where such diseases tend to be more prevalent and health infrastructure lags behind

it is now widely acknowledged that at the beginning of this century claude von pirquet first pointed out that a viral disease i e measles resulted in an anergy or depression of preexisting immune response namely delayed continuous hypersensitivity to ppd derived from mycobacterium tuberculosis thereafter observations that viral infections may result in immunosuppression have been recorded by many clinicians and infectious disease investigators for six or seven decades nevertheless despite sporadic reports that infectious diseases caused by viruses may result in either transient or prolonged immunodepression investigation of this phenomenon languished until the mid 1960s when it was pointed out that a number of experimental retroviral infections of mice with tumor viruses may result in marked immunosuppression however it was not until the recognition of the new epidemic of acquired immunodeficiency syndrome caused by the human immunodeficiency virus and related viruses that acquired immunodeficiencies associated with virus infection became general knowledge among biomedical investigators as well as the lay public a number of reviews published during the past decade or so pointed out that numerous viruses may affect humoral and cellular immune responses furthermore expanding knowledge about the nature and mechanisms of both humoral and cellular immunity and pathogenesis of viral infections has provided clinical and experimental models for investigating in depth how and why viruses of man and animals profoundly affect immune responses
