what is the essence of humanity what would an integrated science of homo sapiens the human species include would such an understanding allow the species to manage itself better is the species making any progress at all along these lines or is its burgeoning material progress the best and most that should be expected of it these are the kinds of questions that this modest little volume has the boldness to address presented as the draft report of the homo sapiens project the book summarizes the current status of the human species including its knowledge and management of itself written as a consultation draft the book seeks feedback from readers and researchers interested in the future of humanity although the report was allegedly written by the homo sapiens project the manuscript was brought to us by a person who prefers to remain anonymous at this time neither that person nor the publisher can validate its authenticity its apparent strength and robustness as an hypothesis convinced us to proceed with publication said the publisher recently read for yourself how the difference or is it war between the sexes plays itself out in the human societies on planet earth read where this species has come from and where it is now according to this ostensibly independent and objective analysis then follow the hints towards the end of the book and muse about how the future of humanity might unfold for the basis for acting on a human future is here too but be warned the knowledge developing from this line of reasoning can be put to both good and evil purposes the choice will be yours to find the right balance for the future of the species once you understand are they human yet poses a rhetorical question with a serious intent help choose a human future read this book

the integument of arthropods was first published in 1951 minnesota archive editions uses digital technology to make long unavailable books once again accessible and are published unaltered from the original university of minnesota press editions this critical monograph presents a review and synthesis of the literature on the chemical physical and biological aspects of the integument of arthropod animals the volume covers and collates material published through 1949 on the chemical and physical properties the structure and development and the permeability of the integument of insects crustacea and their relatives there is in addition an indexed bibliography of some 1800 references and a subject index the first section treats the physical and chemical properties of the entire cuticle and the cuticular components in the second section the structure and development of the integument are traced with a classification of recognizable subdivision and

separate chapters on molting and specialized structures the third section takes up the problems of permeability with emphasis on the complexity and relative scarcity of valid data on the subject most of the references in the bibliography relate directly to the material presented but references to similar phenomena or structures found in other groups of organisms or in artificial models are included to facilitate independent use of the bibliography each reference is followed by a list of the pages where the article is cited fourteen tables and over two hundred line drawings diagrams and photomicrographs grouped into 65 text figures show chemical configurations representative structural details and properties the book provides a much needed reference work for entomologists and those working in related fields of zoology chemistry biochemistry insect physiology and ecology

although usually treated as unified subject in many respects the two components of what is broadly described as medical and veterinary entomology is entomology are clearly distinct as used loosely here to refer to both insects and arachnids in medical entomology blood feeding diptera are of paramount importance primarily as vectors of pathogenic disease most existing textbooks reflect this bias however in veterinary entomology ectoparasites such as the mites fleas or dipteran agents of myiasis assume far greater prominence and the most important effects of their parasitic activity may be mechanical damage pruritus blood loss myiasis hypersensitivity and dermatitis in addition to vector borne pathogenic disease ectoparasite infestation of domestic and companion animals therefore has clinical consequences necessitating a distinct approach to diagnosis and control the aim of this book is to introduce the behaviour ecology pathology and control of arthropod ectoparasites of domestic animals to students and practitioners of veterinary medicine animal husbandry and applied biology since the book is directed primarily at the non entomologist some simplification of a number of the more involved entomological issues has been deemed necessary to improve the book s logical structure and comprehensibility and keep its length within limits a reading list is presented at the end of each chapter to act as a stepping stone into the specialist literature
