an adaptation of social research methods by alan bryman this volume provides a comprehensive introduction to the area of business research methods it gives students an assessment of the contexts within which different methods may be used and how they should be implemented

Social Research Methods 2021-09

we wrote this book for undergraduate students taking a research methods course most often in sociology departments but also in other social science disciplines such as health studies social work and education we cover a wide range of methods and approaches to study design data collection and analysis research methods are not tied to any particular nation and the principles underlying them transcend national boundaries the same is true of this book alan bryman wrote the original text on which ours is based with the needs of british postsecondary students in mind but instructors across europe and canada adopted it as well edward bell later adapted bryman s textbook for canadian instructors and students he preserved the qualities that contributed to the book s initial success its clarity comprehensiveness and presentation of social research methods in an international context while expanding the discussion of canadian and more broadly north american examples sources and research studies we jen reck and jessica fields adapted bryman and bell s canadian text for a u s audience we were initially drawn to the text as a foundation for ours not only because of its clarity and comprehensiveness but also for its attention to qualitative and quantitative methods the text took differences between qualitative and quantitative research seriously but did not assume that those differences are either inevitable or insurmountable we ve tried to preserve these qualities in this adaptation while bringing concerns and commitments of special importance to american readers we emphasize research methods as a tool to understand and address social problems divisions and inequities with which the united states and other countries struggle we approach research as a collection of decisions to be made thoughtfully having considered one s options and with implications and consequences in sight and we highlight the work of scholars from historically marginalized communities in an effort to broaden and deepen the available picture of sociological research our hope is that this book first elevates the work already underway to address inequities and social problems

welcomes a new generation of scholars into the sociological project of seeking understanding as way to promote justice

Graph Colouring and the Probabilistic Method *2002*

over the past decade many major advances have been made in the field of graph colouring via the probabilistic method this monograph provides an accessible and unified treatment of these results using tools such as the lovasz local lemma and talagrand s concentration inequality the topics covered include kahn s proofs that the goldberg seymour and list colouring conjectures hold asymptotically a proof that for some absolute constant c every graph of maximum degree Δ has a Δ/c total colouring johansson s proof that a triangle free graph has a $o(\Delta)$ over $\log \Delta$ colouring algorithmic variants of the local lemma which permit the efficient construction of many optimal and near optimal colourings this begins with a gentle introduction to the probabilistic method and will be useful to researchers and graduate students in graph theory discrete mathematics theoretical computer science and probability

Islamic Studies: A Critical Rationalist Interpretation *2021-01-01*

this book presents the first comprehensive introduction to methods and methodologies in the humanities and social sciences in general and islamic studies in particular from a critical rationalist point of view the book aims to be a self sufficient theoretical and practical guide to the topics that it introduces it contains a large selection of fully worked out review activities and review questions plus topics for further discussion which are devised to assist readers to better understand the issues which are discussed in the book last but not least all efforts have been made to make sure that most if not all of the reading materials which are recommended in the book are not only of the highest quality but also freely available on the internet

in recent years there has been an increased interest in the use of polarization effects for radar and electromagnetic imaging problems references 1 2 and 3 the problem of electro magnetic imaging can be divided into the following areas 1 propagation of the stokes vector from the transmitter to the target region through various atmospheric conditions rain dust fog clouds turbulence etc 2 scattering of the stokes vector from the object 3 scattering of the stokes vector from the rough surface terrain and the volume scattering 4 propagation of the stokes vector from the target region to the receiver 5 the characteristics of the receiver relating the stokes vector to the output the propagation characteristics of the stokes vector through various media can be described by the equation of transfer even though the scalar equation of transfer has been studied extensively in the past the vector equation of transfer has not received as much attention in recent years however a need for further study of the vector radiative transfer theory has become increasingly evident and several important studies have been reported this paper presents a general formulation of the vector theory of radiative transfer under general anisotropic scattering conditions some useful solutions are also presented 4 8 for several practical situations 2 generalization of the

methods for the social sciences introduces statistical methods to students majoring in social science disciplines with an emphasis on concepts and applications this book assumes you have no previous knowledge of statistics and only a minimal mathematical background it contains sufficient material for a two semester course the 6th edition gives you examples and exercises with a variety of real data it includes more illustrations of statistical software for computations and takes advantage of the outstanding applets to explain key concepts such as sampling distributions and conducting basic data analyses it continues to downplay mathematics often a stumbling block for students while avoiding reliance on an overly simplistic recipe based approach to statistics

this festschrift was presented in electronic form to buchanan on the occasion of his eightieth birthday on october 3 1999 after dinner in fairfax virginia as one might have expected the response to our call for papers was vo luminous in looking over the many contributions we felt that a published festschrift was also possible and fitting for the eightieth birthday of so prodi gious and influential a scholar as professor buchanan to that end we have assembled the following volume in selecting the papers to be included here we have basically tried to choose those papers which in some way bear on buchanan s contributions perfectly good papers about issues not related to buchanan s research agenda or not referring directly to buchanan s work were not included space constraints did not allow universal coverage so choices had to be made it should be stated clearly that these were our choices based on the criterion that the contribution be relevant to buchanan s work buchanan had nothing whatsoever to do with the selection of papers for this volume once choices had been made we arranged the papers by subject matter ranging from various aspects of buchanan s work in economics political science philosophy and related areas to some more personal recollections of jim as a professor friend and colleague including the latter material was also our decision and this probably represents a choice with which jim would not have agreed we think however that the reader will find these pieces interesting and informative

this comprehensive presentation of the integral equation method as applied to electro analytical experiments is suitable for electrochemists mathematicians and industrial chemists the discussion focuses on how integral equations can be derived for various kinds of electroanalytical models the book begins with models independent of spatial coordinates goes on to address models in one dimensional space geometry and ends with models dependent on two spatial coordinates bieniasz considers both semi infinite and finite spatial domains as well as ways to deal with diffusion convection homogeneous reactions adsorbed reactants and ohmic drops bieniasz also discusses mathematical characteristics of the integral equations in the wider context of integral equations known in mathematics part of the book is devoted to the solution methodology for the integral equations as analytical solutions are rarely possible attention is paid mostly to numerical methods and relevant software this book includes examples taken from the literature and a thorough literature overview with emphasis on crucial aspects of the integral equation methodology

kazdin s text is a notable contrast to the quantitative methodology approach that pervades the biological and social sciences the methodology in single case reasearch designs focuses on a widely applicable methodology for evaluating interventions such as treatment or psychotherapy using applied behavior anlaysis however this revision aims to encompass a broader range of research areas that utilize single case designs the text will convey the pertinence of this research methodology to disciplines ranging from psychology and medicine to business and industry the first edition of this book which was published in 1982 still sells a steady amount of copies today the fact that professors continue to use the first edition of this book more than twenty years after it was published is a testament to the quality of information organization and narrative throughout the text the possibility of a revision has professors excited that they can expose their students to a well written clear and updated text that will reflect the current status of single case research

the field of medieval studies has shifted towards a growing degree of inter and multidisciplinary during the recent decades the concept of medieval studies covers in fact a multitude of disciplines some of them being loyal to their long established traditions whereas others are very new and borrow methods from other branches of the humanities or even from modern natural or social sciences since this means not only new possibilities but also new challenges sources and methodology should obviously concern anyone engaged in the history and culture of the middle ages regardless of what aspects of the medieval world a scholar is dealing with his or her study has much to gain from a source pluralistic approach in order to be able to understand and even combine different types of sources a scholar must be aware of what methods are relevant and available and how they can be adapted and applied this collection of essays presents a comprehensive overview of current and fresh approaches to the history of medieval europe the topics include among other things the complex relationship between the spoken and the written word explorations in social and geographic space layers and mental images perceivable in medieval texts source edition techniques relics as visual and tangible items not to mention the possibilities offered by prosopography zooarchaelogy and the natural sciences also the question and significance of ethics an ever more important issue in present day academic circles is discussed the contributors to this volume themselves form a very inter and multidisciplinary team although they can all be labeled as medievalists they in fact they work within different disciplines and in several different research units in different countries geographically several parts of europe are covered in the essays â not only the westernmost part of the continent but also the poorly known eastern and northern parts as well this diversity makes the collection worthwhile reading for students and scholars alike

this book deals with a hard problem that is inherent to human language ambiguity in particular we focus on author name ambiguity a type of ambiguity that exists in digital bibliographic repositories which occurs when an author publishes works under distinct names or distinct authors publish works under similar names this problem may be caused by a number of reasons including the lack of standards and common practices and the decentralized generation of bibliographic content as a consequence the quality of the main services of digital bibliographic repositories such as search browsing and recommendation may be severely affected by author name ambiguity the

focal point of the book is on automatic methods since manual solutions do not scale to the size of the current repositories

accordingly we provide an ample view on the problem of automatic disambiguation of author names summarizing the results of more than a decade of research on this topic conducted by our group which were reported in more than a dozen publications that received over 900 citations so far according to google scholar we start by discussing its motivational issues chapter 1 next we formally define the author name disambiguation task chapter 2 and use this formalization to provide a brief taxonomically organized overview of the literature on the topic chapter 3 we then organize summarize and integrate the efforts of our own group on developing solutions for the problem that have historically produced state of the art by the time of their proposals results in terms of the quality of the disambiguation results thus chapter 4 covers hhc heuristic based clustering an author name disambiguation method that is based on two specific real world assumptions regarding scientific authorship then chapter 5 describes sand self training author name disambiguator and chapter 6 presents two incremental author name disambiguation methods namely indi incremental unsupervised name disambiguation and inc incremental nearest cluster finally chapter 7 provides an overview of recent author name disambiguation methods that address new specific approaches such as graph based representations alternative predefined similarity functions visualization facilities and approaches based on artificial neural networks the chapters are followed by three appendices that cover respectively i a pattern matching function for comparing proper names and used by some of the methods addressed in this book ii a tool for generating synthetic collections of citation records for distinct experimental tasks and iii a number of datasets commonly used to evaluate author name disambiguation methods in summary the book organizes a large body of knowledge and work in the area of author name disambiguation in the last decade hoping to consolidate a solid basis for future developments in the field
