the new graph editor this edition also includes additional examples and illustrates nearly every example with the graph editor this timely thoughtful book provides a clear introduction to using panel data in research it describes the different types of panel datasets commonly used for empirical analysis and how to use them for cross sectional panel and event history analysis longhi and nandi then guide the reader through the data management and estimation process including the interpretation of the results and the preparation of the final output tables using existing data sets and structured as hands on exercises each chapter engages with practical issues associated with using data in research these include data cleaning data preparation computation of descriptive statistics using sample weights choosing and implementing the right estimator interpreting results preparing final output tables graphical representation written by experienced authors this exciting textbook provides the practical tools needed to use panel data in research social science and behavioral science students and researchers are often confronted with data that are categorical count a phenomenon or have been collected over time sociologists examining the likelihood of interracial marriage political scientists studying voting behavior criminologists counting the number of offenses people commit health scientists studying the number of suicides across neighborhoods and psychologists modeling mental health treatment success are all interested in outcomes that are not continuous instead they must measure and analyze these events and phenomena in a discrete manner this book provides an introduction and overview of several statistical models designed for these types of outcomes all presented with the assumption that the reader has only a good working knowledge of elementary algebra and has taken introductory statistics and linear regression analysis numerous examples from the social sciences demonstrate the practical applications of these models the chapters address logistic and probit models including those designed for ordinal and nominal variables regular and zero inflated poisson and negative binomial models event history models models for longitudinal data multilevel models and data reduction techniques such as principal components and factor analysis each chapter discusses how to utilize the models and test their assumptions with the statistical software stata and also includes exercise sets so readers can practice using these techniques appendices show how to estimate the models in sas spss and r provide a review of regression assumptions using simulations and discuss missing data a companion website includes downloadable versions of all the data sets used in the book statistics using stata uses a highly accessible and lively writing style to seamlessly integrate the learning of the latest version of stata 17 with an introduction to applied statistics using real data in the behavioral social and health sciences the text is comprehensive in its content coverage and is suitable at undergraduate and graduate levels it requires knowledge of basic algebra but no prior coding experience it is uniquely focused on the importance of data management as an underlying and key principle of data analysis it includes a do file for each chapter that was used to generate all figures tables and analyses for that chapter these files are intended as models to be adapted and used by readers in conducting their own research additional teaching and learning
