to the dagstuhl seminar on logic for system engineering organized during the first week of march 1997 by s jiihnichen j loeckx and m wirsing during that seminar after egon borger s talk on how to use abstract state machines in software engineering wolfram schulte at the time a research assistant at the university of ulm germany questioned whether asms provide anything special as a scientifically well founded and rigorous yet simple and industrially viable framework for high level design and analysis of complex systems and for natural refinements of models to executable code wolfram schulte argued referring to his work with k achatz on a formal object oriented method inspired by fusion and object z 1 that with current techniques of functional programming and of axiomatic specification one can achieve the same result an intensive and long debate arose from this discussion at the end of the week it led egon borger to propose a collaboration on a real life specification project of wolfram schulte s choice as a comparative field test of purely functional declarative methods and of their enhancement within an integrated abstract state based operational asm approach after some hesitation in may 1997 wolfram schulte accepted the offer and chose as the theme a high level specification of java and of the java virtual machine the java virtual machine jvm is the underlying understanding of jvm and leverage this knowledge to optimize application performance in professional environments equip yourself with the expertise needed to tackle real world performance challenges in the ever evolving java landscape the java programming language provides safety and security guarantees such as type safety and its security architecture they distinguish it from other mainstream programming languages like c and c in this work we develop a machine checked model of concurrent java and the java memory model and investigate the impact of concurrency on these guarantees from the formal model we automatically obtain an executable verified compiler to bytecode and a validated virtual machine this insider guide gives the understanding needed to write more effective code for java programs and get maximum performance from java applications both a tutorial and reference the book is easy to follow for java programmers at all levels readers learn what s going on underneath their java programs as they run and gain valuable insights into garbage collection techniques multithreading compilers bytecodes the java interpreter and more the accompanying cd rom contains numerous code examples as well as interactive illustrations that provide valuable programming insights the performance of software components depends on several factors including the execution platform on which the software components run to simplify cross platform performance prediction in relocation and sizing scenarios a novel approach is introduced in this thesis which separates the application performance profile from the platform performance profile the approach is evaluated using transparent instrumentation of java applications and with automated benchmarks for java virtual machines this ibm redbooks publication provides information about the new java virtual machine jvm server technology in ibm cics transaction server for z os v4 2 we begin by outlining the many advantages of its multi threaded operation over the pooled jvm function of earlier releases the open services gateway initiative osgi is described and we highlight the benefits osgi brings to both development and deployment details are then provided about how to configure and use the new jvm server environment examples are included of the deployment process which takes a java application from the workstation eclipse integrated development environment ide with the ibm cics explorer software development kit sdk plug in through the various stages up to execution in a stand alone cics region and an ibm cicsplex environment the book continues with a comparison between traditional cics programming and cics programming from java as a result the main functional areas of the java class library for cics jcics application programming interface api are extensively reviewed further chapters are provided to demonstrate interaction with structured data such as copybooks and how to access relational databases by using java database connectivity jdbc and structured query language for java sqlj finally we devote a chapter to the migration of applications from the pooled jvm model to the new jvm server run time java undoubtedly has its roots in embedded systems and the nevertheless it is a fully functional high level programming language that can provide users with a wide range of functionality and versatility virtual machines vms and i have done for a long time if that makes me sad or an anorak so be it i love them because they are so much fun as well as being so useful they have an element of original sin writing assembly programs and being in control of an entire machine while still being able to claim that one is being a respectable member of the community being structured modular high level object oriented and so on they also allow one to design machines of one s own unencumbered by the restrictions of a starts optimising it for some physical particular processor at least until one processor or other i have been building virtual machines on and off since 1980 or there abouts it has always been something of a hobby for me it has also turned out to be a technique of great power and applicability i hope to continue working on them perhaps on some of the ideas outlined in the last chapter i certainly want to do some more work with register based vms and concur rency i originally the performance of software components depends on several factors including the execution platform on which the software components run to simplify cross platform performance prediction in relocation and sizing scenarios a novel approach is introduced in this thesis which separates the application performance profile from the platform performance profile the approach is evaluated using transparent instrumentation of java applications and with automated benchmarks for java virtual machines

this ibm redbooks publication provides information about the new java virtual machine jvm server technology in ibm cics transaction server for z os v4 2 we begin by outlining the many advantages of its multi threaded operation over the pooled jvm function of earlier releases the open services gateway initiative osgi is described and we highlight the benefits osgi brings to both development and deployment details are then provided about how to configure and use the new jvm server environment examples are included of the deployment process which takes a java application from the workstation eclipse integrated development environment ide with the ibm cics explorer software development kit sdk plug in through the various stages up to execution in a stand alone cics region and an ibm cicsplex environment the book continues with a comparison between traditional cics programming and cics programming from java as a result the main functional areas of the java class library for cics jcics application programming interface api are extensively reviewed further chapters are provided to demonstrate interaction with structured data such as copybooks and how to access relational databases by using java database connectivity jdbc and structured query language for java sqlj finally we devote a chapter to the migration of applications from the pooled jvm model to the new jvm server run time

i love virtual machines vms and i have done for a long time if that makes me sad or an anorak

so be it i love them because they are so much fun as well as being so useful they have an element of original sin writing assembly programs and being in control of an entire machine while still being able to claim that one is being a respectable member of the community being structured modular high level object oriented and so on they also allow one to design machines of one s own unencumbered by the restrictions of a starts optimising it for some physical particular processor at least until one processor or other i have been building virtual machines on and off since 1980 or there abouts it has always been something of a hobby for me it has also turned out to be a technique of great power and applicability i hope to continue working on them perhaps on some of the ideas outlined in the last chapter i certainly want to do some more work with register based vms and concur rency i originally wanted to write the book from a purely semantic viewpoint
