Bibliography 1898 thirty years ago albert einstein died his dream of a theory that would unify the universe unfulfilled he spent the last decades of his life searching for such a theory a theory that would explain everything from elementary particles and their interactions to the overall structure of the universe but he failed not because he didn't try hard enough but because the attempt was ahead of its time when einstein worked on the problem literally nothing was known about black holes white holes singularities the big bang explosion and the early universe quarks gauge invariance and weak and strong nuclear forces today we know that all these things are important in relation to a unified theory and that they must be incorporated in and explained by such a theory thus in a sense our problem is much more complex today than it was in einstein's day but scientists have persevered and as a result we are now tantalizingly close to achieving this long sought goal important breakthroughs have been made in this book we will look at these breakthroughs and at recent unified theories theories that go by the names supergravity superstrings guts and twistor theory in order to understand the problem however we must begin at the beginning
