air pollution has been associated with significant adverse health effects including increased morbidity and mortality the global increase in the prevalence of diseases that are associated with exposure to air pollution is of great concern in particular severe pm2 5 pollution occurs in asian countries due to increasing emissions of air pollutants caused by the countries rapid economic growth a number of studies have been performed to clarify the association between pm2 5 and disorders such as asthma ischemic cardiovascular diseases arteriosclerosis cancer and neurological disorders it is

important to protect populations that are susceptible to such pollution while the characterisation and monitoring of pollutant components currently dictates pollution control policies it will be necessary to identify susceptible populations in order to adequately target prevention strategies for the health effects of air pollution this book offers a comprehensive review of the recent advances in our understanding of the health effects of pm2 5 the role of oxidative stress in these effects the contribution of ultrafine fractions of pm2 5 to the health effects and discusses prevention strategies for these health effects it also suggests further risk assessment risk management and novel policies for pm2 5 pollution required to protect public health

factoring health and related costs into decision making is essential to confronting the nation s health problems and enhancing public well being some policies and programs historically not recognized as relating to health are believed or known to have important health consequences for example public health has been linked to an array of policies that determine the quality and location of housing availability of public transportation land use and street connectivity agricultural practices and the availability of various types of food and development and location of businesses and industry improving health in the united states the role of health impact assessment offers guidance to officials in the public and private sectors on conducting health impact assessments

public health consequences of proposed decisions such as those to build a major roadway plan a city s growth or develop national agricultural policies and suggests actions that could minimize adverse health impacts and optimize beneficial ones several approaches could be used to incorporate aspects of health into decision making but hia holds particular promise because of its applicability to a broad array of programs consideration of both adverse and beneficial health effects ability to consider and incorporate various types of evidence and engagement of communities and stakeholders in a deliberative process the report notes that hia should not be assumed to be the best approach to every health policy question but rather should be seen as part of a spectrum of public health and policy oriented approaches the report presents a six step framework for conducting hia of proposed policies programs plans and projects at federal state tribal and local levels including within the private sector in addition the report identifies several challenges to the successful use of hia such as balancing the need to provide timely information with the realities of varying data quality producing quantitative estimates of health effects and engaging stakeholders
