sustainable development encompasses economic social and ecological perspectives of conservation and change in natural resources it is generally defined as development that meets the needs of the present without compromising the ability of future generations to meet their own needs this definition is based on the ethical imperative of equity within and between generations moreover apart from meeting the basic needs of all sustainable development implies sustaining the natural life support systems on earth and extending to all the opportunity to satisfy their aspirations for a better life hence sustainable development is more precisely defined as a process of change in which the exploitation of resources the direction of investments the orientation of technological development and institutional change are all in harmony and enhance both current and future potential to meet human needs and aspiration to date various definitions and stationary state criteria of sustainability have been proposed many authors have been concerned with only part of the problem such as the technological assumptions the ability to substitute natural resources in economic transformation processes and the resilience and importance of ecological processes but the social dimension did not receive the same attention and has not been adequately integrated into formal analysis the engineering community has to play an important role in sustainable development with appropriate evaluation of the engineering systems in this respect energy water and environment systems require multi criteria evaluation methods for the assessment of the economic environmental and social aspect of the systems

many of the economic road blocks which have previously served to discourage the implementation of alternative power generation technologies can now be readily overcome through effective energy resource optimization it is now a fact that solid financial returns can be achieved from combined heating cooling and power generation projects by integrating energy and cost efficiency goals and seeking a match between power production and heating cooling requirements this book is intended to serve as a road map to those seeking to realize optimum economic returns on such projects the first section provides an introduction to basic heat and power thermodynamics with an overview of heat and power generation technologies and equipment the second section explores the infrastructure in which the project must be implemented including environmental considerations as well as utility rate structures the third section provides detailed coverage of a broad range of technology types and discusses how opportunities for their application can be identified and successfully exploited the final section takes you through each step of project development implementation and operation numerous examples are provided of actual field applications with supporting documentation of system layouts and performance the text is supplemented with more than one thousand graphics including photos cutaway drawings layout schematics performance curves and data tables
