in a world in which global trade is at risk where warehouses and airports shipping lanes and seaports try to guard against the likes of al Qaeda and Somali pirates and natural disaster can disrupt the flow of goods even our stuff has a political life the high stakes of logistics are not surprising Deborah Cowen reveals if we understand its genesis in war in the deadly life of logistics Cowen traces the art and science of logistics over the last sixty years from the battlefield to the boardroom and back again focusing on choke points such as national borders zones of piracy blockades and cities she tracks contemporary efforts to keep goods circulating and brings to light the collective violence these efforts produce she investigates how the old military art of logistics played a critical role in the making of the global economic order not simply the globalization of production but the invention of the supply chain and the reorganization of national economies into transnational systems while reshaping the world of production and distribution logistics is also actively reconfiguring global maps of security and citizenship a phenomenon Cowen charts through the rise of supply chain security with its challenge to long standing notions of state sovereignty and border management though the object of corporate and governmental logistical efforts is commodity supply the deadly life of logistics demonstrates that they are deeply political and considered in the context of the long history of logistics deeply indebted to the practice of war

Logistics

2012

Logistics is the process of planning, implementing, and controlling the efficient, effective flow and storage of goods, services, and information from the point of origin to the point of consumption. It involves the integration of various activities such as transportation, warehousing, inventory management, and packaging. The primary goal of logistics is to ensure that products are delivered to the right place, at the right time, and in the right quantity, while minimizing costs and maximizing customer satisfaction. In the context of supply chain management, logistics plays a crucial role in connecting suppliers, manufacturers, and distributors, ultimately leading to the delivery of finished goods to the end customer.

this book describes the implementation of autonomous control with multiagent technology therewith it tackles the challenges of supply network management caused by the complexity the dynamics and the distribution of logistics processes the paradigm of autonomous logistics reduces the computational complexity and copes with the dynamics locally by delegating process control to the participating objects as an example shipping containers may themselves plan and schedule their way through logistics networks in accordance with objectives imposed by their owners the technologies enabling autonomous logistics are thoroughly described and reviewed the presented solution has been used in a realistic simulation of real world container logistics processes the validation shows that autonomous control is feasible and that it outperforms the previous centralised dispatching approach by significantly increasing the resource utilisation efficiency moreover the multiagent system relieves human dispatchers from dealing with standard cases giving them more time to solve exceptional cases appropriately

seminar paper from the year 2007 in the subject business economics supply production logistics grade 2 0 university of rebro department of business economics statistics informatics esi language english abstract in regard to the text book international logistics i have chosen the chapter logistics and famine relief asking myself the question what logistical problems can arise from natural disasters and how can they be overcome based on the hurricane katrina in august 2005 which has destroyed an entire landscape killing thousands of people and making even more homeless

i have developed my paper by introducing the different modes of transport that exist to support the logistics network in terms of disaster relief plane boat rail road helicopters rescue boats hovercrafts canoes and small boats pointing out the disadvantages and advantages of each mode i came to the conclusion that each of them serves special needs in certain situations so that all of them can be regarded as equal in their function concerning financial factors however the appropriability differs shipment is more expensive than rail transport for example i also found out in which way the modes of transport can reach best the affected areas and how the distribution is organized based on this theoretical framework i have switched to the question how the needs of people change after a natural disaster such as katrina in the short and the long term to put it in a nutshell people long for basic provisions such as food and water in the short term but start to demand for luxury goods such as electricity again in the long term last but not least i have focused in my analysis on special issues that are affected interrupted destroyed etc by natural disasters re routing supply chain and warehousing
