Measure-Valued Solutions for Nonlinear Evolution Equations on Banach Spaces and Their Optimal Control 2013-11-09 at present intensive development of computer hardware and software computer based methods for modeling of difficult problems have become the main technique for theoretical and applied investigations many unsolved tasks for evolutionary systems es are an important class of such problems es relate to economic systems on the whole and separate branches and businesses scientific and art centers

ecological systems populations separate species of animals and plants human organisms different subsystems of organisms cells of animals and plants and soon available methods for modeling of complex systems have received considerable attention and led to significant results no large scale programs are done without methods of modeling today power programs health programs cosmos investigations economy designs etc are a few examples of such programs nevertheless in connection with the permanent complication of contemporary problems existing means are in need of subsequent renovation and perfection in the monograph along with analysis of contemporary means new classes of mathematical models mm which can be used for modeling in the most difficult cases are proposed and justified the main peculiarities of these mm offer possibilities for the description of creation and restoration processes dynamics of elimination or reservation of obsolete technology in es dynamics of resources distribution for fulfillment of internal and external functions of es and so on the complexity of the problems allows us to refer to the theory and applications of these mm as the mathematical theory of development for simplicity the title model development and optimization was adopted

Game Theoretic Problems in Network Economics and Mechanism Design Solutions

2012-12-02 the aim of this book is to lead the reader out from the ordinary routine of computing and calculating by engaging in a more dynamic process of learning this learning by doing approach can be traced back to aristotle who wrote in his nicomachean ethics that for the things we have to learn before we can do them we learn by doing them the theory is illustrated through many relevant examples followed by a large number of exercises whose requirements are rendered by action verbs find show verify check and construct readers are compelled to analyze and organize analytical skills rather than placing the exercises in bulk at the end of each chapter sets of practice questions after each theoretical concept are included the reader has the possibility to check their understanding work on the new topics and gain confidence during the learning activity as the theory unfolds the exercises become more complex sometimes they span over several topics hints have been added in order to guide the reader in the process this book stems from the differential calculus course which the author

taught for many years the goal of this book is to immerse the reader in the subtleties of differential calculus through an active perspective particular attention was paid to continuity and differentiability topics presented in a new course of action
