based on the premise that many if not most reactions in organic chemistry can be explained by variations of fundamental acid base concepts organic chemistry an acid base approach provides a framework for understanding the subject that goes beyond mere memorization the individual steps in many important mechanisms rely on acid base reactions and the ability to see these relationships makes understanding organic chemistry easier using several techniques to develop a relational understanding this textbook helps students fully grasp the essential concepts at the root of organic chemistry providing a practical learning experience with numerous opportunities for self testing the book contains checklists of what students need to know before they begin to study a topic checklists of concepts to be fully understood before moving to the next subject area homework problems directly tied to each concept at the end of each chapter embedded problems with answers throughout the material experimental details and mechanisms for key reactions the reactions and mechanisms contained in the book describe the most fundamental concepts that are used in industry biological chemistry and biochemistry molecular biology and pharmacy the concepts presented constitute the fundamental basis of life processes making them critical to the study of medicine reflecting this emphasis most chapters end with a brief section that

describes biological applications for each concept this text provides students with the skills to proceed to the next level of study offering a fundamental understanding of acids and bases applied to organic transformations and organic molecules

because of the great importance of acid catalysis in the petrochemical industry extensive research has been carried out during the last 30 years concerning the fundamental and applied aspects of catalysis by acids in contrast base catalyzed reactions have received little attention in heterogeneous catalysis the aim of this symposium was to evaluate our knowledge of the important area of acid and base catalysis and to cover a broad range of solids zeolite chemistry being only one aspect of heterogeneous catalysis

many chemists and biochemists require to know the ionization constants of organic acids and

bases this is evident from the science citation index which lists the determination of ionization constants by Albert and E. P. Serjeant 1971 as one of the most widely quoted books in the chemical literature although ultimately there is no satisfactory alternative to experimental measurement it is not always convenient or practicable to make the necessary measurements and calculations moreover the massive pK compilations currently available provide values for only a small fraction of known or possible acids or bases for example the compilations listed in section 1.3 give pK data for some 6 000 8 000 acids whereas if the conservative estimate is made that there are one hundred different substituent groups available to substitute in the benzene ring of benzoic acid approximately five million trisubstituted benzoic acids are theoretically possible thus we have long felt that it is useful to consider methods by which a pK value might be predicted as an interim value to within several tenths of a pH unit using arguments based on linear free energy relationships by analogy by extrapolation by interpolation from existing data or in some other way this degree of precision may be adequate for many purposes such as the recording of spectra of pure species as anion neutral molecule or cation for selection of conditions favourable to solvent extraction and for the interpretation of pH profiles for organic reactions
