Applied Econometric Time Series, 4th Edition 2014-11-03 classical econometrics which plunges its roots in economic theory with simultaneous equations models sem as offshoots and time series econometrics which stems from economic data with vector autoregressive var models as offsprings scour like the janus s facing heads the flowing of economic variables so as to bring to the fore their autonomous and non autonomous dynamics it is up to the so called final form of a dynamic sem on the one hand and to the so called representation theorems of unit root var models on the other to provide informative closed form expressions for the trajectories or time paths of the economic variables of interest should we look at the issues just put forward from a mathematical standpoint the emblematic models of both classical and time series econometrics would turn out to be difference equation systems with ad hoc characteristics whose solutions are attained via a final form or a representation theorem approach the final form solution algebraic technicalities apart arises in the wake of classical difference equation theory displaying besides a transitory autonomous component an exogenous one along with a stochastic nuisance term this follows from a properly defined matrix function inversion admitting a taylor expansion in the lag operator because of the assumptions regarding the roots of a determinant equation peculiar to sem specifications
