

# Ebook free Getting started with oracle data integrator 11g a hands on tutorial .pdf

with the Oracle Data Integrator (ODI) 11g, you can use the `with` clause in SQL to create temporary tables or views. This is useful for complex queries that involve multiple tables and joins. The `with` clause allows you to define a temporary table or view within the scope of a single SQL statement, making the query easier to read and maintain.

For example, you can use the `with` clause to create a temporary table and then query it. Here is an example of how to use the `with` clause in Oracle SQL:

```

with temp_table as (
  select * from table1
)
select * from temp_table

```

In this example, the `with` clause is used to create a temporary table named `temp_table` that contains all the data from `table1`. The `select` statement then queries the `temp_table`.

The `with` clause can also be used to create a temporary view. This is useful for complex queries that involve multiple tables and joins. Here is an example of how to use the `with` clause in Oracle SQL to create a temporary view:

```

with temp_view as (
  select * from table1
)
select * from temp_view

```

In this example, the `with` clause is used to create a temporary view named `temp_view` that contains all the data from `table1`. The `select` statement then queries the `temp_view`.

The `with` clause is a powerful tool for creating temporary tables and views in Oracle SQL. It allows you to define a temporary table or view within the scope of a single SQL statement, making the query easier to read and maintain. The `with` clause is a part of the SQL 99 standard and was added into the Oracle SQL syntax in Oracle 9.2. The `with` clause may be processed as an inline view or resolved as a temporary table.
