not only are rigorous inferences to the best explanation used pervasively in the sciences this kind of reasoning is common in everyday life despite its widespread use inference to the best explanation is still in need of precise formulation and it remains controversial on the one hand supporters of explanationism take inference to the best explanation to be a justifying form of inference some even take all justification to be a matter of explanatory reasoning on the other hand critics object that inference to the best explanation is not a fundamental form of inference and some argue that we should be skeptical of inference to the best explanation in general this volume brings together twenty philosophers to explore various aspects of inference to the best explanation and the debates surrounding it these specially commissioned essays constitute the cutting edge of research on the role explanatory considerations play in epistemology and philosophy of science a free mini book to prepare students for the sat exam with lessons and questions in math reading and writing stereotypes as explanations explores the way that people develop impressions and views of social groups for much of the twentieth century scientists sought to explain objects and processes by reducing them to their components nuclei into protons and neutrons proteins into amino acids and so on but over the past forty years there has been a marked turn toward explaining phenomena by building them up rather than breaking them down this collection reflects on the history and significance of this turn toward growing explanations from the bottom up the essays show how this strategy based on a widespread appreciation for complexity even in apparently simple processes and on the capacity of computers to simulate such complexity has played out in a broad array of sciences they describe how scientists are reordering knowledge to emphasize growth change and contingency and in so doing are revealing even phenomena long considered elementary like particles and genes as emergent properties of dynamic processes written by leading historians and philosophers of science these essays examine the range of subjects people and goals involved in changing the character of scientific analysis over the last several decades they highlight the alternatives that fields as diverse as string theory fuzzy logic artificial life and immunology bring to the forms of explanation that have traditionally defined scientific modernity a number of the essays deal with the mathematical and physical sciences addressing concerns with hybridity and the materials of the everyday world other essays focus on the life sciences where questions such as what is life and what is an organism are undergoing radical re evaluation together these essays mark the contours of an ongoing revolution in scientific explanation contributors david aubin amy dahan dalmedico richard doyle claus emmeche peter galison stefan helmreich ann johnson evelyn fox keller ilana löwy claude rosental alfred tauber civil wars are the dominant form of violence in the contemporary international system yet they are anything but local affairs this book explores the border crossing features of such wars by bringing together insights from international relations theory sociology and transnational politics with a rich comparative quantitative literature it highlights the causal mechanisms framing resource mobilization socialization among others that link the international and transnational to the local emphasizing the methods required to measure them contributors examine specific mechanisms leading to particular outcomes in civil conflicts ranging from chechnya to afghanistan to sudan to turkey transnational dynamics of
