in most of the developed countries of the world significant efforts to control the pollution of surface waters have

been underway for decades and particularly the last 10 15 years these efforts have focused mainly on eliminating or mitigating the effects of point sources of pollution in many cases however it is clear that we have achieved only limited improvement in water quality and that non point sources of pollution are going to control any further improvement it has long been known that urban runoff is a major non point source and much research has been done in an attempt to understand the mechanisms and processes which govern this source and to reduce or eliminate its impacts many urban jurisdictions have adopted urban runoff pollution control measures in spite of the fact that there is a great deal that we still do not know and without really being able to quantify the benefits achieved a major problem is that while a great deal of work is being done both in europe and north america it is very difficult to keep abreast of new developments the urban water resources research council of the american society of civil engineers has for many years had as one of its major objectives the transfer of urban runoff technology among researchers and practitioners in the field as well as to those engineers who are not in the forefront but who nonetheless need the information on the latest developments
