*Innovations and Future Directions in the Behavioural and Cognitive Therapies* 2016 every year we witness acceleration in the availability deployment and use of distributed applications however building increasingly sophisticated applications for extant and emerging networked systems continues to be challenging for several reasons abstract models of computation used in distributed systems research often do not fully capture the limitations and the unpredictable nature of realistic distributed computing platforms fault tolerance and efficiency of computation are difficult to combine when the computing medium is subject to changes asynchrony and failures middleware used for constructing distributed software does not provide services most suitable for sophisticated distributed applications middleware services are specified informally and without precise guarantees of efficiency fault tolerance scalability and compositionality specification of distributed deployment of software systems is often left out of the development process finally there persists an organizational and cultural gap between engineering groups developing systems in a commercial enterprise and research
