this book presents a state of the art technique for formal verification of continuous time simulink stateflow diagrams featuring an expressive hybrid system modelling language a powerful specification logic and deduction based verification approach and some impressive realistic case studies readers will learn the hcsp hhl based deductive method and the use of corresponding tools for formal verification of simulink stateflow

diagrams they will also gain some basic ideas about fundamental elements of formal methods such as formal syntax and semantics and especially the common techniques applied in formal modelling and verification of hybrid systems by investigating the successful case studies readers will realize how to apply the pure theory and techniques to real applications and hopefully will be inspired to start to use the proposed approach or even develop their own formal methods in their future work

stateflow is an environment for modeling and simulating combinatorial and sequential decision logic based on state machines and flow charts stateflow lets you combine graphical and tabular representations including state transition diagrams flow charts state transition tables and truth tables to model how your system reacts to events time based conditions and external input signals with stateflow you can design logic for supervisory control task scheduling and fault management applications stateflow includes state machines animation and static and run time checks for testing design consistency and completeness before implementation stateflow provides graphical and tabular interfaces for modeling system logic by using state machines flow charts and truth tables you can model the different components in your system as states that execute exclusively or in parallel manage the complexity of your design by organizing state diagram objects functions and components hierarchically

simulink enables you to specify physical units as attributes on signals at the boundaries of model components such components can be subsystems referenced simulink models simulink ps converter and ps simulink converter blocks that interface between simulink and components developed in simscape and its associated physical modeling products stateflow charts state transition tables or truth tables and matlab function blocks by specifying controlling and visualizing signal units you can ensure the consistency of calculations across the various components of your model for example this added degree of consistency checking is useful if you are integrating many separately developed components into a large overall system model a conditionally executed subsystem is an atomic subsystem that allows you to control its execution with an external signal the external signal called the control signal is attached to the control input port conditional subsystems are useful when you créate complex models that contain components whose execution depends on other components simulink supports these types of conditional subsystems enabled subsystem executes at each time step while the control signal is positive execution starts at the time step when the control signal crosses zero from the negative to the positive direction triggered subsystem executes each time a trigger event occurs a trigger event can occur on the rising or falling edge of a continuous or discrete trigger signal enabled and triggered subsystem executes once at the time step when a trigger event occurs and the enable control signal has a positive value function call subsystem executes each time a function call event occurs a stateflow chart function call generator block or an s function block can provide function call events in simulink you can use the variant blocks to create a single model that caters to multiple variant requirements such models have a fixed common structure and a finite set of variable components the variable components are activated depending on the variant choice that you select thus the resultant active model is a combination of the fixed structure and the variable components based on the variant choice the use of variant blocks in a model helps in reusability of the model for different conditional expressions called variant choices this approach helps you to meet diverse customer requirements based on application cost or operational considerations
