**Better by Saturday (TM) - Putting** 2017-02-17 transactional memory tm is an appealing paradigm for concurrent programming on shared memory architectures with a tm threads of an application communicate and synchronize their actions via in-memory transactions each transaction can perform any number of operations on shared data and then either commit or abort when the transaction commits the effects of all its operations become immediately visible to other transactions when it aborts however those effects are entirely discarded transactions

are atomic programmers get the illusion that every transaction executes all its operations instantaneously at some single and unique point in time yet a tm runs transactions concurrently to leverage the parallelism offered by modern processors the aim of this book is to provide theoretical foundations for transactional memory this includes defining a model of a tm as well as answering precisely when a tm implementation is correct what kind of properties it can ensure what are the power and limitations of a tm and what inherent trade offs are involved in designing a tm algorithm while the focus of this book is on the fundamental principles its goal is to capture the common intuition behind the semantics of tms and the properties of existing tm implementations table of contents introduction shared memory systems transactional memory a primer tm correctness issues implementing a tm further reading opacity proving opacity an example opacity vs atomicity further reading the liveness of a tm lock based tms obstruction free tms general liveness of tms further reading conclusions

**Modelling Intelligent Multi-Modal Transit Systems** 2015-02-03 one of the most striking properties of biological systems is their ability to learn and adapt to ever changing environmental conditions tasks and stimuli it emerges from a number of different forms of plasticity that change the properties of the computing substrate mainly acting on the modification of the strength of synaptic connections that gate the flow of information across neurons plasticity is an essential ingredient for building artificial autonomous cognitive agents that can learn to reliably and meaningfully interact with the real world for this reason the neuromorphic community at large has put substantial effort in the design of different forms of plasticity and in putting them to practical use these plasticity forms comprise among others short term depression and facilitation homeostasis spike frequency adaptation and diverse forms of hebbian learning e g spike timing dependent plasticity this special research topic collects the most advanced developments in the design of the diverse forms of plasticity from the single circuit to the system level as well as their exploitation in the implementation of cognitive systems
