withering demonstrated 200 years ago in the year 1784 that drop sy could be successfully treated with foxglove extracts this discovery eventually led to the scientifically based treatment of heart failure with chemically defined digitalis glycosides in germany particularly the usefulness of this development was greatly exaggerated and often resulted in the indiscriminate use of digitalis for patients with coronary artery disease and its complications today this type of drug intervention is used more sparingly at the same time other therapeutic concepts were introduced particularly that of drug induced diuresis and the concept of vasodilation this book is the result of a systematic study of various therapeutic approaches for the management of heart failure and includes clinical experimental and theoretical aspects for more than a decade various therapeutic modalities have been clinically evaluated in the setting of acute heart failure managed in the intensive care unit as well as chronic heart failure for inpatient and outpatient therapy experience has shown that in certain clinical situations particularly the management of acute disease specific individual drug intervention is required and is based on the underlying etiology for heart failure however in chronic heart failure long term success can only be achieved by the rational combination of treatment modalities the present text is aimed at providing the clinically and scientifically oriented physician with the pathophysiologic and pharmacologic background necessary to place into perspective the therapeutic efforts for the management of heart failure

although there are probably enough publications about mechanical circulatory support they do not seem to address the theoretical aspects with sufficient details a more detailed knowledge of the interaction between ventricular assist devices vads and the cardiovascular system may help with their clinical management with a view to improve patients outcomes the aim is a different approach based on the development of critical thinking that may generate further ideas in the context of current developments we must understand the time varying elastance theory which has played a key role in cardiovascular modelling and is often used for numerical hybrid simulations of a mechanically supported left ventricle the limitations of the original concept have led to further modifications of the theory and alternative approaches worth exploring ventricular interactions have significant implications in cardiac mechanics and it is extremely important to understand their role during vad support we must understand the physiology of vad support and their connection to the circulation aortic valve physiology during support with rotary blood pumps has important implications on device performance the modelling approach to pneumatic pulsatile vads and their current role is addressed the principles behind magnetic levitation technology are explained in details in view of its contribution to the progress in this field trans cutaneous external transmission energy system technology has great potential but the physics behind it does not get explained enough the potential of a simulation approach in the clinical environment is discussed in relation to optimization of device treatment outcome prediction and training of medical and nursing staff these are some of the key concepts being addressed in this book which biomedical engineers clinicians and academics should hopefully find educational and helpful according to their needs vads have become the standard of care for patients in advanced heart failure but we must understand their strengths and limitations in order to make further progress and achieve their full potential

the unique biology of cardiac fibroblasts and related cells such as cardiac myofibroblasts and valvular interstitial cells distinguish them from other fibroblastic cells a concept that is only beginning to be widely appreciated further the natural signals that stimulate and inhibit cardiac fibrosis within these cells are not well understood this volume compiles articles that address the molecular mechanisms that control the synthesis and secretion of the cardiac ecm the book showcases chapters that highlight discussion of role of transforming growth factor β $\text{tgf}\beta$ an important fibrogenic cytokine and its downstream effectors smad in many cardiac diseases further the contributions highlight information to discuss endogenous inhibitors of cardiac fibrosis as well as advances in tissue engineering specific to matrix in the heart finally discussions of unifying mechanisms of matrix remodeling in valves and myocardium are presented the mechanisms involved in the stimulation of cardiac fibrosis are not fully understood in most cases the marginal attenuation of cardiac fibrosis as a result of a given therapy is a beneficial side effect linked to other primary effects on other cells especially cardiomyocytes very few drugs or agents are known to affect the function and dysfunction of cardiac fibroblasts and myofibroblasts alone the book helps to translate the information gathered within to allow us to alter the course of fibrogenic events that are typical of cardiac fibrosis and thereby reduce their burden on the patient and on society itself
