the next enterprise computing era will rely on the synergy between both technologies semantic web and model driven software development mdsd the semantic web organizes system knowledge in conceptual domains according to its meaning it addresses various enterprise computing needs by identifying abstracting and rationalizing commonalities and checking for inconsistencies across system specifications on the other side model driven software development is closing the gap among business requirements designs and executables by using domain specific languages with custom built syntax and semantics it focuses on using modeling languages as programming languages among many areas of application we highlight the area of configuration management consider the example of a telecommunication company where managing the multiple configurations of network devices routers hubs modems etc is crucial enterprise systems identify and document the functional and physical characteristics of network devices and control changes to those characteristics applying the integration of semantic web and model driven software development allows for 1 explicitly specifying configurations of network devices with tailor made languages 2 for checking the consistency of these specifications 3 for defining a vocabulary to share device specifications across enterprise systems by managing configurations with consistent and explicit concepts we reduce cost and risk and enhance agility in response to new requirements in the telecommunication area this book examines the synergy between semantic web and model driven software development it brings together advances from disciplines like ontologies description logics domain specific modeling model transformation and ontology engineering to take enterprise computing to the next level

the design and functioning of an information system improve to the extent that the system can handle the questions people ask surprisingly however researchers in the cognitive computer and information sciences have not thoroughly examined the multitude of relationships between information systems and questions both question asking and answering the purpose of this book is to explicitly examine these relationships chapter contributors believe that questions play a central role in the analysis design and use of different kinds of natural or artificial information systems such as human cognition social interaction communication networks and intelligent tutoring systems their efforts show that data structures and representations need to be organized around the questioning mechanisms in order to achieve a quick retrieval of relevant useful information
