bacomet cannot be evaluated solely on the basis of its publications it is important then that the reader with only this volume on which to judge both the bacomet activities and its major outcome to date should know some thing of what preceded this book s publication for it is the story of how a group of educators mainly tutors of student teachers of mathematics committed themselves to a continuing period of work and self education the concept of bacomet developed during a series of meetings held in 1978 79 between the three editors bent christiansen geoffrey howson and michael otte at which we expressed our concern about the contributions from mathematics education as a discipline to teacher education both as we observed it and as we participated in it the short time which was at the teacher educator s disposal allied to the limited knowledge and experience of the students on which one had to build raised puzzling problems concerning priorities and emphases the recognition that these

problems were shared by educators from many different countries was matched by the fact that it would be fruitless to attempt to search for an internationally or even nationally acceptable solution to our problems different contexts and traditions rule this out

this open access book features a selection of articles written by erich ch wittmann between 1984 to 2019 which shows how the design science conception has been continuously developed over a number of decades the articles not only describe this conception in general terms but also demonstrate various substantial learning environments that serve as typical examples in terms of teacher education the book provides clear information on how to combine well understood mathematics and methods courses to benefit of teachers the role of mathematics in mathematics education is often explicitly and implicitly reduced to the delivery

of subject matter that then has to be selected and made palpable for students using methods imported from psychology sociology educational research and related disciplines while these fields have made significant contributions to mathematics education in recent decades it cannot be ignored that mathematics itself if well understood provides essential knowledge for teaching mathematics beyond the pure delivery of subject matter for this purpose mathematics has to be conceived of as an organism that is deeply rooted in elementary operations of the human mind which can be seamlessly developed to higher and higher levels so that the full richness of problems of various degrees of difficulty and different means of representation problem solving strategies and forms of proof can be used in ways that are appropriate for the respective level this view of mathematics is essential for designing learning environments and curricula for conducting empirical studies on truly mathematical processes and also for implementing the findings of mathematics education in teacher education where it is crucial to take systemic constraints into account
