a solutions manual to accompany geometry of convex sets geometry of convex sets begins with basic definitions of the concepts of vector addition and scalar multiplication and then defines the notion of convexity for subsets of  $n$  dimensional space many properties of convex sets can be discovered using just the linear structure however for more interesting results it is necessary to introduce the notion of distance in order to discuss open sets closed sets bounded sets and compact sets the book illustrates the interplay between these linear and topological concepts which makes the notion of convexity so interesting thoroughly class tested the book discusses topology and convexity in the context of normed linear spaces specifically with a norm topology on an  $n$  dimensional space geometry of convex sets also features an introduction to  $n$  dimensional geometry including points lines vectors distance norms inner products orthogonality convexity hyperplanes and linear functionals coverage of  $n$  dimensional norm topology including interior points and open sets accumulation points and closed sets boundary points and closed sets compact subsets of  $n$  dimensional space completeness of  $n$  dimensional space sequences equivalent norms distance between sets and support hyperplanes basic properties of convex sets convex hulls interior and closure of convex sets closed convex hulls accessibility lemma regularity of convex sets affine hulls flats or affine subspaces affine basis theorem separation theorems extreme points of convex sets supporting hyperplanes and extreme points existence of extreme points krein milman theorem polyhedral
