with respect to the first edition as volume 218 in the lecture notes in control and information sciences series the basic idea of the second edition has remained the same to provide a compact presentation of some basic ideas in the classical theory of input output and closed loop stability together with a choice of contributions to the recent theory of nonlinear robust and lfoo control and passivity based control nevertheless some parts of the book have been thoroughly revised and or expanded in order to have a more balanced presentation of the theory and to include some of the new developments which have been taken place since the appearance of the first edition i soon realized how ever that it is not possible to give a broad exposition of the existing literature in this area without affecting the spirit of the book which is precisely aimed at a compact presentation so as a result the second edition still reflects very much my personal taste and research interests i trust that others will write books emphasizing different aspects major changes with respect to the first edition are the following a new section has been added in chapter 2 relating l2 gain and passivity via scattering emphasizing a coordinate free geometric treatment the section on stability in chapter 3 has been thoroughly expanded also incorporating some recent results presented in 182j

this text is designed for an introductory undergraduate course in control systems for engineering students there is very little demarcation between aerospace chemical electrical industrial and mechanical engineering in control system practice therefore this text is written without any bias towards one particular discipline thus this book will be equally useful for all engineering disciplines and perhaps will assist in illustrating the utility of control engineering as a controlled discipline
