typically landscape ecologists use empirical observations to conduct research and devise solutions for applied problems in conservation and management in some instances they rely on advice and input of experienced professionals in both developing and applying knowledge given the wealth of expert knowledge and the risks of its informal and implicit applications in landscape ecology it is necessary to formally recognize and characterize expert knowledge and bring rigor to methods for its applications in this context the broad goal of this book is to introduce the concept of expert knowledge and examine its role in landscape ecological applications we plan to do so in three steps first we introduce the topic to landscape ecologists explore salient characteristics of experts and expert knowledge and describe methods used in

capturing and formalizing that knowledge second we present examples of research in landscape ecology from a variety of ecosystems and geographic locations that formally incorporate expert knowledge these case studies address a range of topics that will interest landscape ecologists and other resource management and conservation professionals including the specific roles of expert knowledge in developing testing parameterizing and applying models estimating the uncertainty in expert knowledge developing methods of formalizing and incorporating expert knowledge and using expert knowledge as competing models and a source of alternate hypotheses third we synthesize the state of knowledge on this topic and critically examine the advantages and disadvantages of incorporating expert knowledge in landscape ecological applications the disciplinary subject areas we address are broad and cover much of the scope of contemporary landscape ecology including broad scale forest management and conservation quantifying forest disturbances and succession conservation of habitats for a range of avian and mammal species vulnerability and conservation of marine ecosystems and the spread and impacts of invasive plants this text incorporates the collective experience and knowledge of over 35 researchers in landscape ecology representing a diverse range of disciplinary subject areas and geographic locations through this text we will catalyze further thought and investigations on expert knowledge among the target readership of researchers practitioners and graduate students in landscape ecology

the hilbert-cohuan transform hht represents a desperate attempt to break the suffocating hold on the field of data analysis by the twin assumptions of linearity and stationarity unlike spectrograms wavelet analysis or the wigner-cohuan distribution hht is truly a time frequency analysis but it does not require an a priori functional basis and therefore the convolution computation of frequency the method provides a magnifying glass to examine the data and also offers a different view of data from nonlinear processes with the results no longer shackled by spurious harmonics or the artifacts of imposing a linearity property on a nonlinear system or of limiting by the uncertainty principle and a consequence of fourier transform pairs in data analysis this is the first hht book containing papers covering a wide variety of interests the chapters are divided into mathematical aspects and applications with the applications further grouped into geophysics structural safety and visualization

recent developments in air pollution modeling are explored as a series of contributions from researchers at the forefront of their field this book on air quality modeling and its applications is focused on local urban regional and intercontinental modeling data assimilation and air quality forecasting model assessment and validation aerosol transformation the relationship between air quality and human health and the effects of climate change on air quality it consists of a series of papers that were presented at the 28th nato ccms conference on air pollution modeling and its application held in leipzig germany may 15 19 2006 it is intended as reference material for students and professors interested in air pollution modeling at the graduate level as well as researchers and professionals involved in developing and utilizing air pollution models discusses cutting edge developments on air pollution modeling and air quality issues presents topical and highly relevant subjects to the air quality and modeling research community provides material that can be used to further improve air quality modeling and to inform the community about recent and novel developments in the field

number theory and its applications are well known for their proven properties and excellent applicability in interdisciplinary fields of science until now research on number theory and its applications has been done in mathematics applied mathematics and the sciences in particular number theory plays a fundamental and important role in mathematics and applied mathematics this book is based on recent results in all areas related to number theory and its applications

the single valued neutrosophic set is a subclass of neutrosophic set and has been proposed in recent years an important application for single valued neutrosophic sets is to solve multicriteria decision making problems

the theory of the commodity is used by critical theorists to explain the general organization and development of capitalist society it was originally proposed by marx and subsequently developed by lukacs and later adorno and the frankfurt school media scholars such as dallas smythe judith williamson robert goldman and eileen meehan have identified the commodity structure in several forms throughout the process of mass communication although commodity theory is not always articulated as a part of critical studies it is useful for understanding the process of mass communication under capitalism by investigating the dynamics of market processes and cultural innovation this paper shows where the theory of the commodity fits into critical media studies and suggests where some productive applications may be found

the media today and especially the national press are frequently in conflict with people in the public eye particularly politicians and celebrities over the disclosure of private information and behaviour historically journalists have argued that naming and shaming serious wrong doing and behaviour on the part of public officials is justified as being in the public interest however when the media spotlight is shone on perfectly legal personal behaviour family issues and sexual orientation and when in particular this involves ordinary people the question arises of whether such matters are really in the public interest in any meaningful sense of the term in this book leading academics commentators and journalists from a variety of different cultures consider the extent to which the media are entitled to reveal details of people s private lives the laws and regulations which govern such revelations and whether these are still relevant in the age of social media publisher s website
