industrial applications of batteries looks at both the applications and the batteries and covers the relevant scientific and technological features presenting large batteries for stationary applications e g energy storage and also batteries for hybrid vehicles or different tools the important aerospace field is covered both in connection with satellites and space missions examples of applications include telecommunications uninterruptible power supplies systems for safety alarms car accessories toll collection asset tracking systems medical equipment and oil drilling the first chapter on applications deals with electric and hybrid vehicles four chapters are devoted to stationary applications i e energy storage from the electric grid or solar wind energy load levelling

telecommunications uninterrupted power supplies back up for safety alarms battery management by intelligent systems and prediction of battery life are dealt with in a dedicated chapter the topic of used battery collection and recycling with the description of specific treatments for the different systems is also extensively treated in view of its environmental relevance finally the world market of these batteries is presented with detailed figures for the various applications updated and full overview of the power sources for industries written by leading scientists in their fields well balanced in terms of scientific and technical information

louis marie houdebine and jianglin fan the study of biological functions of proteins and their possible roles in the pathogenesis of human diseases requires more and more relevant animal models although mice including genetically modified mice offer many possibilities other non murine species are absolutely required in some circumstances rabbit is one of these species which has been

widely used in biomedical studies this animal is genetically and physiologically closer to humans including cardiovascular system and metabolism characteristics rabbit is thus more appropriate than mice to study some diseases such as atherosclerosis and lipid metabolism because of its larger size surgery manipulation bleeding and turn over studies are much easier performed in rabbits than in mice furthermore transgenic rabbits can be produced using microinjection and other methods such as lentiviral vectors cloning in rabbits has been proved possible even though still laborious and time consuming hopefully functional rabbit cell lines will be available in the coming years gene deletion or knock out in rabbits will then become possible

during the first decade of the twenty first century worker resistance in china increased rapidly despite the fact that certain segments of the state began moving in a pro labor direction in explaining this eli friedman argues that the chinese state has become hemmed in by an insurgency trap of its own devising and is thus unable to tame expansive worker unrest labor conflict in the process of capitalist industrialization is certainly not unique to china and indeed has appeared in a wide array of countries around the world what is distinct in china however is the combination of postsocialist politics with rapid capitalist development other countries undergoing capitalist industrialization have incorporated relatively independent unions to tame labor conflict and channel insurgent workers into legal and rationalized modes of contention in contrast the chinese state only allows for one union federation the all china federation of trade unions over which it maintains tight control official unions have been unable to win recognition from workers and wildcat strikes and other forms of disruption continue to be the most effective means for addressing workplace grievances in support of this argument friedman offers evidence from guangdong and zhejiang provinces where unions are experimenting with new initiatives leadership models and organizational forms
