this thesis uses the tools of quantum information science to uncover fascinating new insights about the intersection of quantum theory and relativity it is divided into three self contained parts the first of which employs detector models to investigate how the information content of quantum fields depends on spacetime curvature and global spacetime topology the behavior of unruh dewitt detectors on curved spacetimes are investigated following which these detectors are used to probe the vacuum state of a scalar field in various topologies this leads to a generalization of the entanglement harvesting protocol involving detectors in arbitrary curved spacetimes admitting a wightman function the second part extends the theory of quantum reference frames to those associated with noncompact groups motivated by the pursuit of a relational relativistic quantum theory where the group of reference frames is the poincaré group the author then generalizes a communication protocol between two parties lacking a common reference frame to the scenario where the group of transformations of their reference frame is a one dimensional noncompact lie group finally the third part inspired by theories of quantum gravity generalizes the conditional probability interpretation of time a proposed mechanism for time to emerge from a fundamentally timeless universe while the conditional probability interpretation of time is based upon conditioning a solution to the wheeler dewitt equation on a subsystem of the

universe that acts a clock the author extends this approach to include an interaction between the system being used as a clock and a system whose evolution the clock is tracking this book addresses the problems of mathematical relations between global and classical coordinate references from the practical applications point of view it presents a large cartographic and numerical information set which provides great values for practical and academical use based on the classical albanian coordinative reference alb1986 alb1987 this information is reflected from the positional point of view in the new modern albanian satellite reference albpos albanian positioning system or albcors albanian continuous operation reference stations system the main purpose of this monograph is to summarize coordinative references applied in albania in different periods both classical and modern relevant transformation models between traditional classical reference alb1986 alb1987 and gnss satellite reference are presented the book furthermore recommends the mathematical models of the relationship in plan and height between the albanian classical reference and the global european coordinate references itrf euref it serves to professionals involved in fundamental geodetic works as well as all working with gnss or developing gis applications make separate library services for distance learners a thing of the past internet reference support for distance learners takes a comprehensive look at efforts by librarians and information specialists to provide distance learners with effective services that match those already available on campus with the development of the world wide and the evolution of based services reference librarians are adding a human element to the virtual library blurring the difference between distance learners and traditional users this unique book examines how they deal with a wide range of related topics including standards and guidelines copyright issues streaming media and chat and digital references and presents a historical overview of how reference and instructional services have been delivered to distance users before and after
