after showing why ordinary regression analysis is not appropriate for investigating dichotomous or otherwise limited dependent variables this volume examines three techniques which are well suited for such data it reviews the linear probability model and discusses alternative specifications of non linear models many problems in the social sciences are amenable to analysis using the analytical tools of logit and probit models this book explains what ordered and multinomial models are and also shows how to apply them to analysing issues in the social sciences what is the probability that something will occur and how is that probability altered by a change in an independent variable to answer these questions tim futing liao introduces a systematic way of interpreting commonly used probability models since much of what social scientists study is measured in noncontinuous ways and therefore cannot be analyzed using a classical regression model it becomes necessary to model the likelihood that an event will occur this book explores these models first by reviewing each probability model and then by presenting a systematic way for interpreting the results from each log linear logit and logistic regression models are the most common ways of analyzing data when at least the dependent variable is categorical this volume shows how to compare coefficient estimates from regression models for categorical dependent variables in three typical research situations i within one equation ii between identical equations estimated in different subgroups and iii between nested equations each of these three kinds of comparisons brings along its own particular form of comparison problems further in all three areas the precise nature of comparison problems in logistic regression depends on how the logistic regression model is looked at and how the effects of the independent variables are computed this volume presents a practical unified treatment of these problems and considers the advantages and disadvantages of each approach and when to use them so that applied researchers can make the best choice related to their research problem the techniques are illustrated with data from simulation experiments and from publicly available surveys the datasets along with stata syntax are available on a companion website at study sagepub com researchmethods qass hagenaars interpreting regression models for categorical dependent variables in three typical research situations i within one model ii between identical models estimated in different subgroups and iii between nested models additionally this volume presents a practical unified treatment of comparison problems and considers the advantages and disadvantages of each approach and when to use them we compare how logit fixed effects and probit early warning systems ews predict insample and out of sample currency crises in emerging markets ems we look at episodes of currency crises that took place in 29 ems between january 1995 and december 2012 stronger real gdp growth rates and higher net foreign assets significantly reduce the probability of experiencing a currency crisis while high levels of credit to the private sector increase it we find that the logit and probit ews out of sample performances are broadly similar and that the ews performance can be very sensitive both to the size of the estimation sample and to the crisis definition employed for macroeconomic policy purposes we conclude that a currency crisis definition identifying more rather than less crisis episodes should be used even if this may lead Research Methods for Political Science 2020-12-31 an up to date all in one resource for using sas and r to perform frequent tasks the first edition of this popular guide provided a path between sas and r using an easy to understand dictionary like approach retaining the same accessible format sas and r data management statistical analysis and graphics second edition explains how to easily perform an analytical task in both sas and r without having to navigate through the extensive idiosyncratic and sometimes unwieldy software documentation the book covers many common tasks such as data management descriptive summaries inferential procedures regression analysis and graphics along with more complex applications new to the second edition this edition now covers rstudio a powerful and easy to use interface for r it incorporates a number of additional topics including using application program interfaces apis accessing data through database management systems using reproducible analysis tools and statistical analysis with markov chain monte carlo mcmc methods and finite mixture models it also includes extended examples of simulations and many new examples enables easy mobility between the two systems through the extensive indexing and cross referencing users can directly find and implement the material they need sas users can look up tasks in the sas index and then find the associated r code while r users can benefit from the r index in a similar manner numerous example analyses demonstrate the code in action and facilitate further exploration the datasets and code are available for download on the book s website
