the first chapters uncovers the origins of the first paragraph or chapter divisions in copies of the christian scriptures its focal point is the magnificent fourth century codex vaticanus vat gr 1209 b 03 perhaps the single most significant ancient manuscript of the bible and the oldest material witness to what may be the earliest set of numbered chapter divisions of the bible the first chapters tells the history of textual division starting from when copies of greek literary works used virtually no spaces marks or other graphic techniques to assist the reader it explores the origins of other numbering systems like the better known eusebian canons but its theme is the first set of numbered chapters in codex vaticanus what nineteenth century textual critic samuel p tregelles labelled the capitulatio vaticana it demonstrates that these numbers were not as most have claimed late additions to the codex but belonged integrally to its original production the first chapters then breaks new ground by showing that the capitulatio vaticana has real precursors in some much earlier manuscripts it thus casts light on a long continuous tradition of scribally placed visual guides to the reading and interpreting of scriptural books finally the first chapters exposes abundant new evidence that this early system for marking the sense divisions of scripture has played a much greater role in the history of exegesis than has previously been imaginable

this book deals with the application of spectroscopic techniques for characterisation of chemical and physical structures in viscoelastic materials such as unvulcanised elastomers and their vulcanisates various rubbery materials and some plastics which when blended with particular additives plasticisers behave like rubbers analysis of the rubbery materials is complicated by the fact that rubbery products such as tyres tubes seals v belts and hoses contain in the rubbery matrix a significant amount of various compounds i e fillers vulcanising agents antioxidants and plasticisers due to the complex composition no single technique can provide a good understanding of the effect of chemical and physical structures on the functional properties of rubbery materials thus spectroscopy has become a powerful tool for the determination of polymer structures the most comprehensive information on chemical and physical structures in relation to material properties can be obtained by using a combination of macroscopic techniques and methods that provide information on the molecular level frequently used for analysis of rubbery materials i e various methods of nuclear magnetic resonance nmr and optical spectroscopy the main objective of this present book is to discuss a wide range of applications of the spectroscopic techniques for the analysis of rubbery materials the book brings together the various spectroscopic techniques for obtaining the following information chemical structure of rubbery materials network structure analysis heterogeneity of rubbery materials physical properties of rubbery materials functional properties and stability of rubbery materials processing of rubbery materials and quality control the contents of this book are of interest to chemists physicists material scientists and technologists who seek a better understanding of rubbery materials
