## ***what s the difference between a motor and a drive***

Apr 24 2024

a motor is the mechanical or electrical device that generates the rotational or linear force used to power a machine a drive is the electronic device that harnesses and controls

## **motor drives how it works application advantages magnetism**

Mar 23 2024

motor drives regulate the electrical energy that motors need to operate modifying the input power to control the speed and rotation of the motor this allows for precise control of the system to which the motor is connected enhancing efficiency and performance

## **design engineers**

Feb 22 2024

electric motors that drive industrial machines need some way to control motor speed and at its most basic level a motor drive controls the speed of the motor some manufacturers refer to a controller and motor together as a drive system

## **what s the difference between a motor and a drive**

Jan 21 2024

a motor is an electrical device that generates the rotational or linear force used to power a machine a drive is an electronic device that controls the electrical energy pass to the motor

## combinations

Aug 16 2023

the basic idea is easy to understand integrated motor drive systems combine a motor and a drive at the very least and some integrated motor variations also include other components such as controllers and encoders note that sometimes these integrated motion subsystems are simply called drives
