Fracture, Fatigue and Structural Integrity of Metallic Materials

2020-05-13

fracture fatigue and other subcritical processes such as creep crack growth or stress corrosion cracking present numerous open issues from both scientific and industrial points of view these phenomena are of special interest in industrial and civil metallic structures such as pipes vessels machinery aircrafts ship hulls and bridges given that their failure may imply catastrophic consequences for human life the natural environment and or the economy moreover an adequate management of their operational life defining suitable inspection periods repairs or replacements requires their safety or unsafety conditions to be defined the analysis of these technological challenges requires accurate comprehensive assessment tools based on solid theoretical foundations as well as structural integrity assessment standards or procedures incorporating such tools into industrial practice this volume is focused on new advances in fracture fatigue and structural integrity of metallic structural components containing defects e g cracks notches metal loss etc and also on those developments that are being or could be incorporated into structural integrity assessment procedures such as bs7910 r6 or api 579 1 asme ffs 1

body composition in infancy may be of importance for later health in particular infant body composition may be relevant regarding obesity risk in childhood recent advances in body composition methodology using air displacement plethysmography adp have provided possibilities to accurately measure body composition of infants in a quick and non invasive manner the aims of this thesis were to study associations of parental body composition using adp glucose homeostasis during pregnancy and infant genetics with infant body composition also using adp when using adp in adults a correction for the thoracic gas volume tgv is needed and tgv can be predicted using equations developed in nonpregnant adults thus another aim was to study the validity of using such equations during pregnancy parent couples were invited to this study at a routine visit to a maternity clinic in linköping between september 2008 and october 2010 when the mother was in gestational week 32 parental body composition using adp and maternal glucose homeostasis variables were assessed size and body composition of healthy singleton and full term 37 gestational weeks infants were measured at 1 and 12 weeks of age and a total of 211 infants were included in the studies weight and length at 1 year of age were reported by parents saliva samples were collected from the infants to obtain dna for genotyping of the fat mass and obesity associated fto gene body composition results calculated using measured and

predicted tgv were compared in 27 women results showed that predicted tgv yields a very marginal overestimation 0.5 of fat mass fm further each kg increase in maternal and paternal fat free mass ffm was associated with 15.6 g p 0.001 and 9.1 g p 0.007 respectively more ffm in their 1 week old infants fm of fathers was not related to infant fm however maternal fm was positively associated with fm of daughters 5.8 g/kg p 0.007 but not of sons p 0.79 at 1 week of age similarly each standard deviation increase in maternal homa-ir homeostatic model assessment insulin resistance was related to 52.7 more g of fm p 0.001 in 1 weekold daughters but no such relationship was found for sons p 0.79 the number of risk alleles at the fto locus rs9939609 was not associated with infant body mass index bmi or infant fm at 1 or 12 weeks of age however the number of risk alleles was positively associated p 0.033 with infant length at 1 and 12 weeks of age and the results suggested that this association was stronger in boys than in girls the results presented in this thesis show that i the use of predicted tgv when applying adp in gestational week 32 overestimated fm only slightly ii associations between parental and infant body composition are present early in life thus parental ffm was positively related to ffm in 1 week old infants furthermore maternal fm and insulin resistance homa-ir were positively related to fm of 1 week old daughters but no such relationships were observed for sons iii the fto genotype is not associated with infant body fatness at 1 or 12 weeks of age however the results suggested that the number of fto risk alleles is positively associated with infant length especially in boys in conclusion parental and genetic factors were associated with infant size and body composition and these relationships may be of importance for future body composition and health

some of the most serious consequences of aging are its effects on skeletal muscle sarcopenia the progressive age related loss of muscle mass and associated muscle weakness renders frail elders susceptible to serious injury from sudden falls and fractures and at risk for losing their functional independence not surprisingly sarcopenia is a significant public health problem throughout the developed world there is an urgent need to better understand the neuromuscular mechanisms underlying age related muscle wasting and to develop therapeutic strategies that can attenuate prevent or ultimately reverse sarcopenia significant

research and development in academic and research institutions and in pharmaceutical companies is being directed to sarcopenia and to related health issues in order to develop and evaluate novel therapeutics this book provides the latest information on sarcopenia from leading international researchers studying the cellular and molecular mechanisms underlying age related changes in skeletal muscle and identifies strategies to combat sarcopenia and related muscle wasting conditions and neuromuscular disorders the book provides a vital resource for researchers and practitioners alike with information relevant to gerontologists geriatricians sports medicine physicians physiologists neuroscientists cell biologists endocrinologists physical therapists allied health and musculoskeletal practitioners strength and conditioning specialists athletic trainers and students of the medical and biomedical sciences

2010-11-30

in dealing with fracture and fatigue assessments of structural components different approaches have been proposed in the literature they are usually divided into three subgroups according to stress based strain based and energy based criteria typical applications include both linear elastic and elastoplastic materials and plain and notched or cracked components under both static and fatigue loadings the aim of this special issue is to provide an update to the state of the art on these approaches the topics addressed in this special issue are applications from nano to full scale complex and real structures and recent advanced criteria for fracture and fatigue predictions under complex loading conditions such as multiaxial constant and variable amplitude fatigue loadings
