diseases caused by animal parasites remain on a worldwide basis among the principal causes of morbidity and mortality this book gives the medical student and the practitioner the basic information about parasitic protozoa worms and anthropods and the diseases they cause that will enable the reader to recognize and manage them one is impressed with the broad scope of the subject the diversity of the parasitic modes of life and how much there is yet unknown about the biology of parasitism at the same time the book provides vignettes of the often fascinating historical background of our knowledge of animal parasites and glimpses of current research that is beginning to shape the future of parasitology william trager ph d professor emeritus of parasitology the rockefeller university new york new york preface this book fills the need we have felt in teaching parasitic diseases to medical students many of the available texts are too detailed for what is inevitably an introductory course others that do treat this subject with appropriate brevity are now out of date still others lack documentation of references and thus fail to guide the readers to a broader understanding of this subject we have addressed ourselves to medical students but they are not our sole target clinicians unfamiliar with the complexities of parasitic diseases need a guide to the diagnosis and management of these infections we intend our book to serve this function as well

the globalization and commercialization of the food system has unintentionally led to the introduction of new foodborne parasites in countries worldwide fortunately advances in detection and control are providing the basis for a better understanding of the biology and control of parasitic infections and this in turn will likely contribute to the reduction and hopefully elimination of parasitic foodborne outbreaks building on the first edition this completely revised second edition of foodborne parasites covers the parasites most associated with foodborne transmission and therefore of greatest global public health relevance the volume examines protozoa and their subgroups the amoeba coccidia flagellates and ciliates chapters also address trypanosoma cruzi recently recognized as an emerging foodborne protozoan the helminth section is expanded to cover teniasis cysticercosis hydatidosis and the trematodes and nematodes including angiostrongylus which is present worldwide finally the editors examine the burden and risk assessment determinations that have provided a scientific framework for developing policies for the control of foodborne parasites

when we were first approached by the senior editors of this series to edit a book on interactions between the host and infectious agents we accepted this offer as an exciting challenge the only condition readily agreed upon was that such a book should focus on the immunology of infections in humans our reasons if not biases were several fold we sensed that the fields of microbiology and immunology which had diverged as each was focusing on its individual search were coming together in agreement with the opinions expressed by dr richard krause in the introduction we strongly believed that the development of the immune system evolved in response to infectious agents and that the evolution of these agents was influenced in turn by the character of the host's responses an intensive examination of the multitude of primitive or more recently developed host defense mechanisms to determine their relative contribution to man's resistance to a given infectious agent appeared to us to be of crucial basic and practical interest many immune mechanisms studied in animals were being explored in humans and it appeared timely to focus particularly on what was known about man's resistance to infectious agents correlating this information with lessons learned from relevant experiments in animal models

this book intensively examines the efficacy of plant derived products that have been used for over a thousand years by practitioners of so called traditional chinese medicine in the light of recent chemotherapeutics the chapters were written by renowned chinese medical researchers and are supplemented by results obtained in german antiparasitic research projects parasites and emerging diseases are a major threat of our time which is characterized by an enormous increase in the size of the human population and by an unbelievably rapid globalization that has led to the daily transport of millions of humans and containers with goods from one end of the earth to the other furthermore the slow but constant global warming offers new opportunities for many agents of diseases to become established in new areas therefore it is essential that we develop precautions in order to avoid epidemics or even pandemics in overcrowded megacities or at the large scale farm animal confinements that are needed to secure a steady flow of food in the crowded regions of the world of course intensive research in the field of chemotherapy since 1900 has produced unbelievable breakthroughs in therapies for formerly untreatable and thus deadly diseases however a large number of untreatable diseases remain as well as a constantly growing number of agents of disease that have developed resistances to standard chemical compounds as such it is not only worthwhile but also vital to consider the enormous amounts of information that have been obtained by human high cultures in the past examples from the past like quinine or present like artemisinin a modern antimalarial drug show that plant extracts may hold tremendous potential

in the fight against parasites and or against vector transmitted agents of diseases
