Commitment in Organizations 2019-07-16 why psychology is in peril as a scientific discipline and how to save it psychological science has made extraordinary discoveries about the human mind but can we trust everything its practitioners are telling us in recent years it has become increasingly apparent that a lot of research in psychology is based on weak evidence questionable practices and sometimes even fraud the seven deadly sins of psychology diagnoses the ills besetting the discipline today and proposes sensible practical solutions to ensure that it remains a legitimate and reliable science in the years ahead in this unflinchingly candid manifesto chris chambers shows how practitioners are vulnerable to powerful biases that undercut the scientific method how they routinely torture data until it produces outcomes that can be published in prestigious journals and how studies are much less reliable than advertised left unchecked these and other problems threaten the very future of psychology as a science but help is here

The Seven Deadly Sins of Psychology 2012-04-23 as the title genesis xli 18 of the book indicates interest in dreams goes back at least to biblical times it persisted during subsequent years to peak in the 20th century following publication of sigmund freud s major work the interpretation of dreams freud was concerned with the psychology of dreams perhaps because biological science of that era was not ready to provide physiological explanation of the purpose of dreams much neuroscience has been discovered in the century since freud to permit a new view of sleep and dreams a great deal has been learned about the what of sleep its stages electrographic accompaniment eye movements muscle atonia and behavioral manifestations there are ideas about the why of sleep restorative processes protein synthesis secretion of growth hormone clearing of adenosine immunologic enhancement and consolidation of memory only a little is known of the what of dreams cerebral areas that are activated and deactivated on imaging studies cerebral lesions that cause loss of dreaming and a bit about ontogenesis the why of dreams remains uncertain in this brief monograph dr locke offers a bold new hypothesis about the purpose of the dream following chapters on sleep memory and the structure of the dream he suggests that one function of sleep and dreams is to establish neurological cellular networks to accept new memories the muscle atonia of rem sleep deactivates neural networks in motor cortex cerebellum and basal ganglia to allow them to accept new motor algorithms of procedural memory the structure of the transient and preparatory dream its narrative and imagery is selected during rem sleep by a largely inhibited hippocampus that permits only incomplete retrieval of neural assemblies accounting for the distortion condensation fusion and confusion of the dream new neural assemblies are activated in parietal cortex by dreams that are promptly forgotten to allow the unoccupied network held in readiness by snaptic tags to accept new declarative memories in the waking state of the new day
